ok now i have this guy figured. i should have known your an AE member. just so everybody knows AE is a free band group that he readily admitted to being a member of. anybody from 11 meters knows about AE01 TOM in Rhode Island and his friend across the atlantic Ae111 Roy. those guys are the two most foul mouthed, linear running stations youll ever hear on the freebands. Mr Kasupski you can try to pull all the bullshit you want but i know my freeband and the different groups on it. you would not be a AE member if you werent on the freeband at one time or another.

>And we have one set of CB sideband numbers (AE279).

>Therefore, I must conclude that the only reason that you don't like to
>see the ham call in their also is that you're jealous because you
>don't have one too.

jealous of a tech class liscence? no not me. how many dxcc do you have on 50 megs and higher? i enjoy talking to people in far away places, not communicating with nerds on a repeater.

your monitor ID doesnt matter and you old Cb calls are irrelevent too. like i said before on this news group we are all equal. ham calls or any other like it doesnt make a bit of difference here.

>>>73 and good DX'ing,
John D. Kasupski
KC2FNG, KNY2VS, KJK-14120, KSO-9650, AE279

And we have one set of CB sideband numbers (AE279).<<<

The AE Dx group is a freeband organization. you dont have to take my word for it just tune around and listen on 11. they are not a very big group so you dont hear members daily but almost everybody is familiar with the rantings of AE01 Tom in Rhode Island and AE111 Roy across the atlantic and the Sporadic waves magazine that focuses on illegal freebanding and is published by a fellow AE member. The AE group is known for causing any type trouble they can so i guess kasupskis just doing it here now. AE01 and AE111 are worse than the crap on 3950 except they do it all on 11 meters, cursing, carriers, and all. Kasupski is a troll, plain and simple. he's talking about following regulations according to part 95 yet he blatently associates his self with freebanders??? why not go try to clean up your own club before worrying what people you have nothing to do.

Oh Brother.

Wake up and smell the production line. Nothing is made in America. CB's haven't been made except in China and Maylasia for the past 3 years. So I suppose we will all just close our doors and stop selling Everything.

Its the same sweat shops putting together at less than 50 cents an hour and there is nothing that we can do to stop it. It is not in our control

Make sure you look at all the parts that put put you around on the highways. Oh. And that computer your typing on. MMMM Wonder where that was put together or the parts bought to put it together. Morals have nothing to do with it.

Whew. Sorry had to get that off my chest.
We work very hard to be fair to our customers. At least I didn't say it would suit everyones needs.

Every CB does have a purpose.

Happy CBing and chatting. Sharing idea's is what learning is all about. When you shut off hearing you shut out learning. I hear you and will make it a point to try to find American made CB's and components.

Just have someone hold the Antron in the air overhead out in your open yard. It does not need a ground plane to work properly. Check the match, and it should be just fine before you install it in the tree.

If you don't like the 80 meter band because of the reasons you state
above, then you must not like anything about cb because you just
described the entire cb band as well.

Source record: 8399

To those whom have claimed the 102" whip is the beat all end all because that's what the books tell you, think again.....
Last night we tested many antennas. To make a long story short, the Valor 60" "HalfBreed" antenna was within 2% of the performance (under) the 102". What beat it? A 7' Skipshooter tied with TX and beat it on RX, and (no way) the Wilson 5000 beat it hands down on both TX and equaled it on RX. Was there anything better than the Wilson 5k? Yes, a homebrew SINGLE COIL aluminum mobile antenna, about 60" tall, edged out the Wilson on TX, and was above all others on RX except a 1/2" x 107" copper pipe.
Want something cheap and unobtrusive that works? 60" Half Breed
Want something that works a little better? Wilson 5000
Want the best? Get one of those big ass aluminum coils.

Where can you get a replacement microphone for those things? My
stepdad is a ham (W0PDI) and I'd like to get one for him, along with a
mobile antenna. He has been kind of quiet on the bands since he and
my mom sold the house in Florida with the 85-foot crank-up and
5-element beam. Man, what a signal that thing would put out, even
"barefoot"!

>legally on 11 meters or on any other band.

But that is not what is being discussed the majority of time on this newsgroup. Most of the time its a ham telling a CBer how stupid he or she is for not getting their ham license and talking to the wonderful people on 2/10/80 meters when we all know that the people using CB have no desire to talk to hams. And this is exactly what the CB band was made for, local comms between people and businesses who don't want a ham license.

>>The 11-meter band definately has its place in society. It has been

>be illegal operation on 11 meters? What does your opinion of the
>people who operate on 2 meters, or anywhere else for that matter, have
>to do with illegal operation on 11 meters?

My opinion has to do with the fact that instead of hams telling CBers to get their ham licenses so they can then operate with high power, which we know the CB operator does not want to do (get their ham license), how about the ham operator explaining to the CBer how to operate legally, and why they should. And then, when the CB operator ignores or disrespects the ham operator, the ham operator can leave the newsgroup and be done with it.

>>this and talking to people on 2-meters but the greater majority of
>>people will not. And if they did, then 2 meters would be just as

>losing those licenses by acting like a Toilet Bowl Commando on 2
>meters or anywhere else.

I'm sorry, but if every CB operator got a tech license and moved to
2-meters, there would be exactly the same type of jamming and cussing,
and rudeness that is found on channel 6. There would be way to many
operators to enforce any kind of control over the band, especially if
they didn't use their callsigns. This will obviously never happen,
and I only said this to try to show how ludicrous it is for hams to
come on this newsgroup and tell CB operators that they should stop
being dumb, and get their ham license.

>>The 11-meter band fits a certain nitch perfectly. The problem is that
>>people are using it outside its design parameters and this is causing

From over 20 years of operating various FT101E, EE and EX models, I will stand by what I said. It may be better than the run-of-the-mill CB radio, if you have the rf speach processor, but it is NOT a good AM rig. The Drakes and early Kenwood rigs were much better.

I never had an AM board for my FT101ZD - so don't know how it would have compared.

I doubt if there is that much of a threat. The major problem with HF is the high noise level. It causes problems with unlicensed low power wireless devices. It also requires rather large antennas to get any useful range.

With the opening of the various GHz bands, and low cost solid state component availability, I would expect most of such devices to operate there. If not, then in various of the government bands - as secondary users.

Let me set the scenario first. I have a small compact car with the antenna on the trunk. SWR is perfect 1:1. The antenna is a half home built, half store bought (MY antenna). I tried Wilsons and others but this works better. I don't want a huge antenna, and this one is only around 5 feet tall. It is essentially a center loaded antenna, with an open coil. The coil is just above the roof of the car, and it's about 2 inches in diameter using apporx 10ga wire for the coil. Alright now for the technical questions. Everyone says a 102" whip is the best overall antenna. I can usually catch some skip with MY antenna so I decided to borrow a whip to use in my driveway for better skip. When I removed MY antenna and screwed in the whip (fiberglass) I lost damn near every signal I had. I was catching some locals on the way home and out where I live the signal drops off pretty good, but you can still make contact. I had a good signal with MY antenna, but just barely could catch the locals in the background noise with the whip. I thought maybe this guy killed his antenna somehow, so I got another. This time stainless steel. Guess what same results. In either case I didn't try transmitting becasue SWR was whacked from being on the trunk, but from losing the signal it wasn't even worth trying. So to all of you techs out there why did this happen? It's not a big deal I guess, but it goeas against everything everyone says. If for some reason MY home built works better than a whip, I think I'm gonna be rich!!! Let me know what you think, and if you guys want me to try something else I will. I want to do a little research on this, I'm sure others will too.

My first antenna was a K40. Then I played around with a 5' Firestik II, Antron 1700, and a big ass double coil X-terminator. Not one was any better than my original K40. Now I'm thinking about getting a Wilson 1000 magmount and calling it quits. Is the 1000 worth buying? How does it compare to the K40 in regards to transmitting and receiving? Will it handle 26 to 28 mhz and still retain a low SWR? Thanks.

That's about the truth! I just rigged up one of my handhelds with a cigarette lighter power cord, and bought a $10 antenna from Wal-Mart tonight. Switched ends on the antenna, and wired up the power cord to the CB, and voila! I was impressed at the range I got with this setup... I could listen for about 5 miles, and talk to people within 2 miles easily, and very clearly. All for under $50.

I guess I'll play with these handhelds for a while, and then pick up a mobile CB unit and decent antenna later.

Danno

Of course they do. And I never said they didn't. I said the local law enforcment officials charging "illegal" operators with violating local statutes that are not based on the actual use of the radio (hince does not fall under federal jurisdiction).

I'll try to explain this again. When you play your music sterio too loudly, you are not charged with playing a sterio, you are charged with disturbing the peace. The same priciple can be applied to radio. You are not charged with operating a radio illegally, you are charged with "depriving" the neighboring homeowner "of the peaceful enjoyment of his/her property" (words often used in connection with disturbing the peace statutes).

You dismiss the entire body of 2 meter ham operators by describing
them as nerds and then have the nerve to say that _WE_ have an elitist attitude?

> 2 meters isnt 8 times bigger because we
> operate anywhere between 25 and 28 megahertz anytime we feel like it.

Of course, I could point out that the use of those extra frequencies
is illegal but, for the sake of argument, I won't. Even with those
frequencies, the 2 meter band alone is still larger. And, in addition,
we also have the 6 meter band, the 1.25 meter band, the 70 cm band, the
33 cm band, and the 23 cm band. And that is not even counting the
entire selection of HF bands.

And, even with all this, we still can use the CB band also. And this
fact alone does not support your argument above (the argument that you
don't want to get a ticket because you would have to talk to others on a
repeater). If you got your ticket, you would be able to participate in
many different radio modes, frequencies, and methods. And you would
still be able to talk with your friends on CB as well.

You're not losing anything by getting a ham license. And you are
gaining a wealth of other capabilities. Anyone who would pass all that
up just so they can use an illegal linear, and play with noise toys, is
a damn fool.

A pair of stacked 4's wouldn't need a rotating tower as you put it. A Ham IV rotator would do the trick just fine. If you were in a high wind area you could use thrust bearings to keep the weight of the antenna off the rotator. Stacked threes are light enough that even the CDE 45 with the wedge break module added would do fine. Again use thrust bearings if in really high wind area.

There was a fellow in the local area (he went silent key recently) who had a pair of the Maco Laser 400's stacked side by side. He was using the "Tailtwister" rotator without thrust bearings or any other extra bracing and had no trouble at all turning that hugh array around (boom length approaching 40' or so for one of the two beams)

> listen to your spew.

First of all Toll, you do not speak for the "rest of the world." You might not like what I say, but you are certainly not the "rest of the world." In fact, considering the huge backlash against CB operators in this country, it is fairly obvious that CB has very little support left in the this country.

And that is exactly why I am arguing that the "illegal" crap has to end. If not, new federal laws, now and in the future, will allow local governments to regulate CB operators right out of existence.

> Who gives a shit? We have more operators in the CB radio service than you

> 2 megs of space. So, who is wasting spectrum? Why do you think that UPS
> now owns half of one of your "precious bands"... 2 down, FCC only has a
> number to sell off... Don't throw stones when your own house is made of
> glass.

Man, you guys keep harping on the loss of a few frequencies. Years ago ham radio lost a few frequencies because ham operators didn't use them. So what? If they were not used, they obviously didn't have much value to ham operators. The government should have given them to someone that did value them.

All of that does not, even for a moment, suggest that our commonly used bands are threatened. Ham radio is not going to disappear anytime soon. And neither is our allocation of radio frequencies.

> C. Why? We seem to have all the fun we need where we are. Why do you feel
> the need to force people off of CB (when you yourself said that you have
> that band, too) and onto ham radio? <snip>

When have I ever tried to "force people off of CB?" I have repeatedly said that a person with a ham license can also continue to use CB, so is not losing a thing.

I'm not asking anyone to choose between CB and Ham radio. I'm urging people to add the new capabilities they would gain through Ham radio to the existing capabilities they already have with CB.

I simply cannot understand why you would find that idea so objectionable.

Dwight, I know the passion for radio you have as I have it too. I guess I have gotten callused to the way CB is and can't see the forrest for the trees. I still have the choice to turn it off or change the channel. That is what those knobs are for. I don't expect others to conform to the way I see things. There are things I can do to take matters into my own hands without the participation of anyone else. I can talk as far as I want right now. The only limitations I have are on the RX. How do I hear better? Let's see, First we'll do the High-gain antenna thing (You know the kind that falls three houses over on the lady that always complains), next, you assign yourself a covert mission to infiltrate your local hamfest and bring back one of those $400 H.F. receivers. After I've done all this work I realize I still have 39 more channels! If this does not work then I put it in the "poor conditions" basket and turn the whole thing off!

First of all, we're doing a lot to clean up our own bands. Pop over to the ham newsgroups to see the great many messages complaining about the bullcrap happening on certain ham bands. Hollingsworth himself has said that the FCC has received hundreds of complaints from Amateur radio operators complaining about the actions of other Amateur Radio operators, and urging the FCC to enforce the regulations better on the ham bands.

We also have a group of people (myself included) that is concerned that this enforcement action may go overboard. While we want enforcement, we don't want to see people pushed out of amateur radio because they have unpopular political views or make an occasional mistake.

Finally, I can't speak for Bullon. I don't know the person, and I don't know if the things you say about him is true (I don't know you either). All I can say is what I know about ham radio. And I have generally found that to be a very positive experience. And I honestly

think most other CB'ers would also (which is why I promote it every chance I get).

I have also generally found CB if be a very positive experience, which is why I still use it. Both radio services have value.

John, I was responding to the specific statements of a single person.
Don't take those comments out of context and apply them to an attack on
anything else.

> The issue here should be over the
> illegal use of 11-meters. Not about
> why a certain licensed band is
> better than an unlicensed one.

If you were to read the other messages I have posted to this
newsgroup, you would clearly see that I agree with that statement
entirely. I have never advocated one radio service over the other. I
have urged CB operators to add capabilities of Ham Radio to their
existing capabilities. When talking about ham radio, I'm not asking
anybody to choose one service over the other - I'm urging them to have both.

> Most people don't want to take the

>free - no cellular phone charges (now that has to be worth something).

i'm sure this would be no trouble at all on one of the new ssb handhelds that
are capable of covering the whole 11 meters not just 450khz.

> As for skip communications, CB cannot even begin to compare to Ham
>radio. And we won't even discuss the more advanced modes that you can't
>even use.

why dont it compare? when CB was a ham band it was the most productive band
there was during high sunspot times(ten meters took that honor and its not open
as much as 11), FYI were in a peak sunspot time now. ive said it before, i
have 112 confirmed countries contacted on 11 meters ssb (its common for
europeans to have even more) from the last cycle all with 25 watts out of a

lincoln and a antron 99, if thats not good i dont know what is for a supposed no dx band. what modes cant we use? were freebanders, remember? we dont follow rules, we can use any mode we want. i guess you have never monitored the many packet stations that boom in from europe everyday. listen between 27.7 and 27.8 when conditions are good. youll be really suprised.

> If you honestly think that the Tech license has nothing to offer, then
>you really are dumber than I thought.
>

it has nothing to offer me, that i want. i enjoy dx and making friends worldwide not line of sight talking.

> If we were in a vegetarian newsgroup, and you had discovered something
>that would benefit others in that newsgroup, I most certainly expect you
>to spread the news.

ok you missed the point. which i fully expected anyways.

> But again, you're twisting the facts. You talk about forcing me to
>eat all my vegetables. How does that compare to what I am doing in this
>newsgroup?

twisting facts? i was simply making a paralell statement that has nothing to do with ham/cb so you could get the point, its obvious you did and dont want to adress it.

> I am not forcing anything. Indeed, I don't have the power
>to force a thing.

agreed. that ticket you have makes you nothing except the lowest form ham there is.

> You can either read them, or
>ignore them.

i choose to read them kinda as a joke.

THE CANDYWRAPPER
It was another Payday and I was tired of Mr. Goodbar.
I saw Miss Hershey standing behind the Powerhouse on
the corner of Clark and Fifth Avenue when I
whipped out my Whopper and whispered,
"Hey! Sweetheart, how'd you like to Crunch on my big
hunk for a Million Dollar Bar?" Well, she
immediately went down on my Tootsie Roll, and it was
like pure ALMOND JOY! I
couldn't help but grab her delicious Mounds because it
was easy to see that this
little Twix had the Red Hots. It was all I could
do to hold the Snickers and
Crackle as my Butterfinger went up her tightlittle
Kit Kat and she started
to scream "Oh Henry, Oh Henry!" Soon she was
fondling my Peter Pan and
ZagNut and I knew it wouldn't be long before I
blew my Milk Duds clear to
Mars that gave her a taste of the old Milky Way.
She asked me if I was into
M&M, but I said, "hey Chicklet, no kinky stuff."
I said "Look you little
Reese's Pieces, don't be a Zero, Be a
Lifesaver. Why don't you take my
Watchamacallit and slip it up your Bit ~O~
Honey?"(What a piece of Juicy
Fruit she was too!) She screamed, "Oh
Crackerjack, better than the
ThreeMusketeers!" As I rammed my Ding Dong up
her Rocky Road and into her
Peanut Butter Cup. Well, I was giving it to her
Good ~N~ Plenty, when all of
a sudden... My Starburst! Yeah, as luck would
have it, she started to grow
Chunky and complained of a Wrigley in herstomach.
Sure enough, 9 months
later, out popped..... Baby Ruth!

I was given a TRC-430 CB, and need to know what fuses I need to install
inline as they are missing.
Also, there are three wires for power (positive, negative, and a
third). What's the third, and where does it hook up?

Thanks for the help!

Just because someone belongs to a group that has a few members that have no respect for rules and regulations, it doesn't automatically make them the same type of operators. Anymore than stating that because there are a few CBr's that could care less about rules and regulations that NONE of them do.

Get a Texas Star 250.

Nearly the same physical size as the smaller amps, but packs a 275+ watt punch.

Or, if size is really what matters, and not cost, the Texas Star 350 will do ya right. Same physical size as the 250, and only a few dollars more.

They both work on SSB, too.

Toll Free

> Nonsense. There is no way that you can talk realiably for more than a
> few miles (especially during the day).

Really, I suggest that you get out a map and look at the distance from Houston, Texas to Dallas Texas and Houston to the Louisianna border. I talk this distance quite a lot.

Houston to Beaumont, too.

Guess again, Techie... We CBers have the distance thing going for us, too.

Get two decent base stations together, and I have talked (across the gulf.. Large water bodies carry signals farther) well into Louisianna.

With my simple base station in
> Bremerton WA, I can talk to people over an area starting at about
> Vancouver BC in the North going to about Portland OR in the South. That
> is a range of about 125 miles in any direction.

I can do that with my base station on 11 meters. Who cares.

And I can cover that
> range twenty-four hours a day, seven days a week.

So can I, when I find a clear frequency.

Don't tell me that is the problem with CB, either. If I am tying up the repeater in your link, then you can't do a damn thing. I know. I was one of the original members of the 220 meg Condor Connection, that linked up Tijuana Mexico to the Canadian border.

I have been at this a little longer than you think.

>
> Using repeaters, I can talk to people as far away as Boise ID, Eastern
> WA, and Southern OR. That is a range of about 400 miles. And I can
> cover that range twenty-four hours a day, seven days a week.

You fail to impress me. I can do nearly the same thing, with my own station being the limiting factor, not someone elses repeater.

11 meter operators have also begun to set up repeaters, linked via telephones. The duplexers involved would be a little large for the average man to carry up, but it can be done.

>
> Because of that great range, I have just as many people to talk to as
> you do with your CB.

Gee, takes you an entire network of repeaters to carry on a conversation
with the same amount of people I can with 4 watts at 27 megs?

Tell me where the innefficient use of bandwith is.

While you are limited to talking to people within
> a few miles of your home,

Oh BS.

I can talk to people living over a much
> greater area.

Oh BS.

And just as many ham operators live in that extended area
> as CB operators live within a few miles of your home.

So, once again (since you said that I was full of it earlier), you prove my
point. CBRS has more people, crammed into a smaller section of bandwith,
and we use less power than you do!

>
> My wife, working in Seattle, can talk to me using nothing more than a
> five watt handheld. Her office is about twenty miles from our home.

Repeater goes down!!!!

Now what.

You have no comms.

> And, if needed, she can do that twenty-four hours a day, seven days a
> week -

Repeater goes down!!!!

Now what.

You have no comms.

including the daylight hours when a CB handheld would be lucky to
> cover a mile. She is never out of touch when she needs me.

Repeater goes down!!!!

Now what.

You have no comms.

And its
> free - no cellular phone charges (now that has to be worth something).

Repeater goes down!!!!

Now what.

You have no comms.

Seems to be a recurring item here.

>
> As for skip communications, CB cannot even begin to compare to Ham
> radio.

Guess you don't believe the ARRL then, eh? They love to endorse the
different types of "skip conditions" that are available on 10 meters.

Remember, we are not that far off. And it usually takes less power to make
a contact on 10 than it does on 40.

Antennas are easier to construct.

And we won't even discuss the more advanced modes that you can't
> even use.

Like what?

Packet? Been their, done that.

Any other digital modes? A simple soundcard and PC will do that for the
CBRS.

Clover? Why?

>
> If you honestly think that the Tech license has nothing to offer, then
> you really are dumber than I thought.

Been there, done that. The tech license is a beginners license. I have
done more building, experimenting (antennas, not included. I do more with
them at VHF and above) and such on 11 meters just because it is fun.

And with CB, you have an asshole channel or two.

With the 2 meter and above crowd in my area, you have the asshole spectrum.

So, Senor Tech License holder, like I said before. I suggest that you
actually explore some of the venues that you so fondly talk about, rather
than spewing the same garbage that all the other hammers have come here and
done.

Be original.

Stop whining.

If you don't like CB, then go away.

Simple to say.

Too hard for you to do.

Most repeaters are turned off by DTMF tones.

Capture the on / off tone sequence, and you can turn the repeater off an on
at will.

Galaxy is an accepted brand of radio (the DX series) with the FCC.

They where raided last year, and the FCC didn't issue a cease and desist order.

Incidentally, they DON'T ship converted radios, they are all 10 meters, and they will NOT convert for you.

Color your face RED, an Antron's match could and
would be affected by being close to the earth. Read Dwight Stewart's very good explanation. So the only point that was proved was by you, care to guess what that point was? (Who's the mudduck now?)

the origanal subject was "would being close to a tree cause problems?", and the answer is no! ive had too many antennas work just fine in trees with the same good match that i had on the ground

Debbie;

Thanks for the info about the 75wxst. My wife has decided that is the radio for her car. The radio performs well with the exception of the squelch. You described it as choppy. My description (as a non-technical user) is that it is harsh. It is either off or it is on. Very abrupt change from quiet to talk. My question is can this be adjusted any way?

I had a Anton 99 on a pole 5' off of the ground, the match is damn near perfect, with 10 watts in on the bird 43 it would barely move the miliwatt slug on reflect, I have not tuned it since I removed it from the top of a 50' push up pole, the match was the same there as it was on the 5' pole on the ground.
So my point was still proved, how many times have you had this problem with an Anton? I personally know that a tree would affect it because of its location as opposed to the radiation pattern of this antenna, Hightower why dont you explain to the group how the earth would affect this antenna, but say guy wires at the base of the Anton would not, also explain to me how tuning (as John put it) would help an antenna that was reacting to something close by, Now I could understand if John had said something about matching the antenna, inductance, capacitence etc. etc., but he told the guy that "some tuning might be required" all he did was point the guy in the wrong direction, It sure is funny how you post so little, but when you do you stick your foot in your mouth taking up for a asshole whinebag, who instead of helping someone out only confuses people.

:>ham wanna be. You would think a real ham who looks for DX on 15 meters
:>would be doing what he is doing. No, a real ham would not waste his time like
:>Rick does. Don't get me wrong; I am not a real ham.

Well, lets see. I'm an Extra class since 1972. That was after I
dropped out in (as an Extra)1954 due to family, funds, and having
to move around a good bit with the FAA. During WWII I was a Army
Signal Corps radio operator assigned to the Navy on a trans-atlantic
troop & equipment hauler. Yea that's right, I used to have to swim
that pond with the wolf packs and I know how to make it pucker up
son. I also worked with Tropical Radio down in the south doing the
"banana boat swing" and we're not talking about some needle on
a meter either. By the way, when I first started with the Signal Corps
before WWII, I was able to use the Ham station and we didn't even
have a "W" or a "K" in front of the call.

While with the FAA, I was always after the other guys in TN to join me
on the high bands. I loved 10 meters and when the FCC took away
11 meters I said "Oh well, there is still plenty of room." I'm
getting pretty darn old now as you can guess and I figure that its
time to do something about my 10 meter band. You got part of it
way back and I figure that's about enough.

CB has given such a bad name to Amateur operators with their
spit 'en splatter boxes, RFI, and total disregard for the rules
that I guess its time for me to help out again. I've saved so
many people's lives with the FAA it ain't even funny. I've
handled Mars traffic during both the Korean & Vietnam wars when
families used to come to my house or call on the phone praying
for just a small message from their loved ones or please send
this message to them. Whenever I hear that jerk talking about
"what have I done to help with kids on drugs" it really pisses
me off. I'll tell you what I've done, I've raised 6 children
(lost the first two by childhood illnesses at age 5 & 12, a girl
& a boy and this was before Danny Thomas got with the folks
at St Jude) I raised them to be good upstanding law abiding
citizens. And I'm helping with their children now.

But lets set the record straight before you get the wrong idea.
I could care less what anyone of you guys or gals do down there

on the CB band. The FCC gave it to you so I'll go along with that. But when you come up on my section of 10 meters then you just crossed the line. As you can guess I love CW. I fought for my piece of the band and I intend to use it. I can take the bad rep you and your goons gave me and my goons. I don't care that you get drunk and cuss so I can't let my great grand daughter listen to a CB. Hell, I wouldn't even care that you use those amps as long as you keep that trash from bleeding over on my $1800 Kenwood. More power to you. But Mr FCC wants some help on it so "ICM" for him.

But when you come above 28.000 or wipe out my QSOs because you don't operate that trash blaster correctly then you went just a tad to far. And what you guys don't seem to get is that Old Mr FCC doesn't need to much funding when there are bunchs of us who are fed up with it. I've been retired now since 1980 and the wife went SK 2 years ago. I've got all day to sit on the radio and read this computer and if Riley needs some help with you people you can damn sure bet he is going to get it. And you just don't realize how many Hams are jumping on this band wagon sonny boy.

Its very simple, keep it in YOUR section of the band and I'll do the same. Don't splatter on mine and I won't hock up the gain or fire up the RTTY on you. But you don't seem to be able to take the hint too well so I guess we will just have to do some of MR FCC's leg work for him and lets see if that gets any results.

I've helped no less than 32 CBers with their stations when they asked me to. Mainly because I sympathized with them because their neighbors were going to call the law or FCC on them. So I helped them get rid of their RFI. Even with their amps. But NO MORE. Its coming son so you had better get ready. And we know not to let on what we are doing at the local Ham club or Fests. We know a lot of them and we are looking for the others. We have some of those smart whipper snappers that work at ISP's gathering data. Hams perfected the art of DFing for the FCC. And it was Hams that helped develope the radio "finger printer". All it really needs now is a little more backing by law makers and we WILL be looking up your back door. And we all know how the general public feels about that CBer blasting out their phone and TV so you can bet that whatever law needs to be changed will most certainly get the proper doctoring for this to work.

And to Rick and the others who are trying to talk some since into you, keep it up fellas as more are coming.

>direction.

What would you do about guy wires? Don't say use insulators, I had my antron
up without insulators and still had damn near 0 reflective watts. And why
would you need a well-grounded metal pole to acheive a better match? you
allready try to make a point that to much counterpoise would affect this
antenna, grounded for lightning, rfi etc. etc. but your not making yourself
clear.

> The GPK-1 ground plane kit will slightly improve line-of-site
> distance, but will slightly decrease skip performance. In other words,
> the ground plane kit will pull the signals closer to the ground, with

Acording to you anything close to the antenna will affect its performance.
and how will this lesson the performance in DX? I would think this would
lower your angle of radiation causing this antenna to not be as much of a
"cloud burner"
Do you think that straight up is the best way to work DX? the RF energy is

wasted.

>spend the thousands of dollars to hear and try to talk to the elite hams
>on this band.

Well, you are missing one of the advantages of ham radio.. the properties of the bands that hams can operate vary quite a bit. In June I was talking to a ham in Hawaii at 10pm from NJ... don't get propigation like that on CB at 10pm...

There are benefits and disadvantages to all things, even being a ham (gasp!). There are guys I would rather not associate with and I am ashamed to admit that they are hams, just as there are CB'ers that I would rather not associate with, but you get good and bad on both...

I've been to 2-3 sites that have mic wiring but can't find any info
on Dak radios. I'm trying to find out 3 wiring diagrams. 1.) for a 5
wire d104 to dak 10. 2nd) Turner +3 to Dak 10. 3rd) Turner +3 to ts-5010

Thanks,
Jeff

98. Re: Anyone know the chip in the NEW RS rig

Newsgroup: rec.radio.cb
Date: 1999-11-01 00:00:00 UTC
From: bill <bwiese>
Message-ID: <01bf24c2$7b9968d0$6c84c03f@bill_pc>
Source record: 8483

The chip in question is a Sanyo LC72322N.

{ If you check out the Sanyo Semiconductor website (terrible
layout, arrangement, etc.) you can download 9 out of 13 .PDF
pages of the chip spec (other 4 pages inaccessible due to
website bug). [Apparently they can't figure out how to do a
13-page Acrobat document without creating 13 PDF files!] }

However, it's an all-in-one chip - it contains:
- 4-bit CPU, RAM/ROM;
- LCD controller;
- 150MHz PLL synth;

Without changing the firmware - which would involve resoldering
in a new, differently programmed chip, akin to a ChipSwitch - this
rig's gonna live on 10 meters only. I have seen no jumpers or
easy-to-cut traces on the control/CPU/PLL board. The PLL seems to
be a programmable-register-driven one so there's no external
programmable divider wiring that could be tweaked to move anything.

Xtal modifications/switching could poss. move this - won't know
till I see the schematic.

FM may not be super useful as many (but certainly not all) 10m FM
repeaters use CTCSS (PL) access. You'll have to put on a CTCSS
generator... one of the Communications Specialists boards or use
a M/X Com chip that has both PL encode/decode on it. Also, this
PL tone would then be externally controlled and not stored as part
of a channel memory.

I have to admit that I like the Wilson better than the K-40. I was running a K-40 years ago but received a lot of engine noise/external noise. When I switched to the Wilson 1000, it disapeared!

I now run a "Big Foot" (which is pretty much the same thing as a Firestick) 3' antenna and it works great.. SWR's are FLAT across the band...

Thanks Bill, looks like it's back to the HR 2510/2600/Lincoln with the Chipswitch after all. I guess Radio Shack didn't want to feel the wrath of the FCC on this new rig, although, I'm sure the OEM is Uniden anyway. Other similar radios, such as the SuperStar 4900+, and the Magnum Delta Force can be futzed with, but alas not our ol' radio on the corner store brand.

Phil I am well aware of the woodpecker, You are talking about something that isnt even remotely close. The woodpecker was transmitting on bands that had conditions to the US at the particular time of day they felt like jamming/interfering . We are also talking about a RADAR thats what the woodpecker is with more watts than any cber and probably most of the regulars on superbowl 6 can muster in there wettest of dreams . You cannot return a signal back to Earth if the ionsphere absorbs that particular wavelength Otherwise the bands all would be open 24 hours a day. We would be able to speak to you daily by just brute force power anytime of the day.It is impossible to alter the laws of physics Read below about the WoodPecker

From their own homes, many ham radio operators have quietly carried on an electronic war with the Soviet Union for the last six years and, in some cases, are winning. Their battle is with a powerful Soviet radar signal dubbed the "Russian Woodpecker."

The "woodpecker," as it is now almost universally known because of its unmistakable sound, still disrupts shortwave communications. Its signals have long since been traced to locations within the Soviet Union.

It is, experts agree, a Soviet over-the-horizon radar system. Radio waves in what is called the shortwave range, which are actually longer than those in the VHF or microwave range, are, unlike the others, "bounced" off upper regions of the Earth's atmosphere and returned to the ground. This is how you receive faraway foreign stations on your shortwave radio.

The "skip" also is used to get a radar signal over the horizon and back to detect incoming airplanes.

The Soviets, however, have ignored internationally~accepted rules about what frequencies can be used by whom, and simply transmitted their ultra-high-powered radar signals on any frequency where "skip" conditions are good at the particular time. Their signal also is unusually "wide," blocking out a large number of other stations.

"If you want to screw up a radar signal, all you have to do is send a return signal on its frequency which blocks out the echos. Hams, from the earliest woodpecker days, have been driving the monster off their bands by getting on the frequency and sending properly spaced dots back. The screen somewhere in Russia blanks out and the operators utter some Russian oaths and change the frequency to get rid of the interference."

It works, too, say many hams who have tried it, although it greatly helps if several hams in different locations "gang up" on the radar's frequency

Whats the Call OM,
I agree also I don't think unlicensed cbers should go on 10 meters there is plenty of space below 28 megs. As far as running power I can tell you without a shadow of a doubt many many hams run way over the legal limit. They too cause RFI which is a fault of the manufacturers of the affected devices.

On July 4, 1976, the Soviet Union began generating powerful electromagnetic transmissions, that were dubbed "The Russian Woodpecker" by western ham radio operators. The Russian signals are primarily pulsed at the very dangerous 10 Hertz Extreme Low Frequency (ELF). It has remained on the air more or less continuously ever since. Varying up and down through the frequencies between 3.26 and 17.54 megahertz, it is pulse-modulated at a rate of several times a second, so it sounds like a buzz saw or woodpecker. It was soon traced to an enormous transmitter near Kiev in the Soviet Ukraine. This transmitter and others like it are believed to be based upon the original design of Nikola Tesla.

Hello alltogether,

announcement:
What: 8th "Rheintal Electronica 99"
(Radio and Electronic exhibition, fair)

Date: This Saturday, 6th November 1999
Time: opening 9.00 a.m. (CET) Ending about 4.00 p.m.

Where: Durmersheim (Germany, south of Karlsruhe, South-Germany)
Parking: For free, free bus-transfer to the exhibition

Radio Assistance
CB-Radio : Ch. 15 FM (27.135 kHz)
Amateur-Radio: 145,500 MHz F3E

Program:
- private Sale of
CB- and Amateur-Radio (used and new sets)
Computer, Software, electronic Spare-Parts, Accessoires
- Demonstrations
- German CB-Musuem (800 CB radios in one Luxury Coach)
- Dealer Exhibition
- Information from RegTP (Regulation Authority)

- contributions and discussions (in german language)
* GPS und Funk-Applikationen (Dr. Karl H. Ilg (DK2WV))
* Gestaltung einer eigenen Homepage (Hans Jï¿½rgen Schlager)
* Der Weg zur Amateurfunk Klasse 3 (Martina Lohse)
* Vergangenheit und Zukunft des CB-Funks? (Henning Gajek)
* Packet-Radio auf CB-Funk - Ein Netz mit Zukunftsperspektiven?
(Dr. Andreas Koch)

> operate with high power <snip>

John, I seriously doubt that you will find many ham operators advocating that CB'ers get a ham license so they can operate with high power. One of the basic priciples of proper radio operation is to use of as little power as necessary. That priciple is supported by regulations applying to virtually all radio services, including Amateur Radio.

Instead, Amateur Radio is about learning the skills of putting together a well-constructed radio station that can communicate over great distances without the use of excessive power.

There are certainly occassions where higher power levels are required, such as EME communications (bouncing signals off the moon back to other locations on Earth). But, considering the losses associated with this type of operation, higher power is not excessive in this case.

But, other than these rare operating modes, high power is not really needed. For example, satellite communications over a range of several thousand miles can be accomplished with only a few watts (many have done it with nothing more than a 5-watt handheld radio in one hand and a small beam antenna in the other hand).

> And then, when the CB operator ignores
> or disrespects the ham operator, the
> ham operator can leave the newsgroup
> and be done with it.

John, as we have explained in other messages, we ("the ham operator") also use CB radios, so this newsgroup also belongs to us. Why should we leave just because we also have have a Ham license?

> I'm sorry, but if every CB operator got a tech license and moved to
> 2-meters, there would be exactly the same type of jamming and cussing,
> and rudeness that is found on channel 6.

You have made this argument before, but I don't buy it. Would the problems increase if more people got a ham license? Most certainly. But I think that Amateur Radio can handle those problems. For one thing, there is no such thing as anonymous operation on the ham bands. The FCC has greater ability to monitor the Amateur Radio bands and many ham operators have RDF skills. By the way, this explains why CB'ers who

operate illegally on the 10 meter ham frequencies are located so quickly.

Plus, most new ham operators quickly realise they have more to lose from illegal operation. In addition to the loss of operating privileges, there are serious fines involved. For many, once they realise the benefit of Amateur radio, the potential loss of operating privileges is enough to prevent them from operating illegally.

Personally, I don't really care who you consider, or don't consider, a "real" ham.

> Secondly You were issued a license on
> Aug 3, 1999. How can people think you
> represent the ham community, you havent
> even gotten your feet wet.

You need to learn how to use the callsign search engines. The date you refer to above is the date my current license, with new address, was issued. It is not the date my first license was issued.

And, since you are looking up license information, I should also point out that I had a Ham license in Germany for about seven years before getting my first US license (german wife - dual citizenship). So, to clear the air, I've had a ham license for about nine years in total.

But, regardless of that, I don't claim to represent the ham community. I claim to be part of that community, nothing more.

Wait till you see what is going on with the various DOTD's in several states. Ask any trucker that knows his "Red Book" what it says about operating heavy equipment while engaged in illegal activities. And they thought those Federal Licenses was just to track speeding tickets and DW/DUI's.

Do you realize how much money both the federal & state crumblements could make with a serious crack down on illegal CB use just in the trucking industry? Kinda makes you wonder if those blasted alarm, phone, & other techno device companies are in on it with them. All they have to do is get those DOTD boys to start checking for amps when they pull em over for an inspection. One man at a weigh station doing a cab check could make bundles for them. And it even leaves the trucking companies out of the picture. After all, they didn't put it in there, the driver did.

If they ever get it to where the local cops can confiscate CB equipment and impose fines (after all, they need some sort of self-funding incentive) for interference to home devices, you can bet that it will be plastered all over newspapers where irrate homeowners can do the leg work for them.

It wouldn't surprise me a bit if Ol' Good Buddy Billy Tarzan down in louisiana hasn't got something in the works already.

> would be affected by being close to the earth.

I'll take care of this one, John. First of all Kovorkian, you can start learning about this by reading the Solarcon A-99 owners manual. Under the installation instructions, it says... "For best performance, mount your antenna at least nine feet above the roof of the nearest building and 18 feet above or away from any metal object or structure."

Under the troubleshooting section concerning SWR problems, it states... "Be sure the antenna is installed at least 9 feet above the roof of the nearest building and 18 feet above or away from any other metal objects in the area."

The reasons for these warnings, Kovorkian, is that an antenna of this type is adversely affected by nearby objects. This would also include the ground. Of course, since very few people would mount an antenna like this that low to the ground, I would imagine that Solarcon did not see any reason for mentioning the ground in the manual.

Now, we can get into a complicated explination of why an antenna might be affected by nearby objects, but it might be easier to realise if you simply tried it for yourself. Locate the antenna near the ground and take an SWR reading. Now locate the antenna ten feet in the air on a metal pole and take another reading. You will quickly see that the SWR drops as the antenna is moved higher above the ground.

With the A-99, it is possible to get a good SWR reading over wide range of frequencies if it is installed correctly according to the instructions. In fact, with this antenna, best performance can be achieved by installing the antenna about forty feet in the air on a well-grounded metal pole, with no object within twenty-five feet in any direction.

The GPK-1 ground plane kit will slightly improve line-of-site distance, but will slightly decrease skip performance. In other words, the ground plane kit will pull the signals closer to the ground, with less signal going up into the air above the antenna.

By the way, one word of warning about the A-99 installation. Make sure to use the two included lock washers between the three antenna sections. The antenna was designed to be used with these two lock washers in place - the SWR was tuned with these lock washers in mind, and the lock washers insure good electrical connection between the antenna sections (important as the connections age).

Johnny, I read your letter and I couldn't help but notice a couple of your statements. In your letter to the FCC you said that you have recently become a new Ham, after years of being a long time CB operator. I then went to QRZ and looked at your date of birth, which states that you are about 41 years old. This is my question:

Why, after all of this supposed time spent on CB, are you all of a sudden infuriated with illegal CB activities, and why did it take you 24 years to get your Ham license? (your KSO-9650 CB call is from Aug/1975) There was more illegal CB activity in your area of NY in the 70's than there is right now.....why the all the NEW concern?

My limited experience would agree with Dwight and John. When I bought my A99 I initailly just hooked it up and leaned it agaisnt the fence to see if it worked. The SWR was high but not unusable (3:1). I later mounted it on 30' pole attached to the side of the house (house is 18' high at gutters two feet of pole is in ground) and the SWR is 1:1. The Radio is a Uniden Madison.

The metal of your car is blocking the signal of your handhelds. An outside antenna can easily increase your range by a couple of miles.

Take a run to Radio Shack and buy a couple of cheap magnetic mount antennas (item 21-989 it not bad to start out - about $20 each). Note that a longer antenna is generally better than a shorter one. Make sure the antenna plug will fit your radio or get an adapter (item 278-120 / PL-259 to BNC - about $4 each).

Also, be warned that the batteries will go dead very quickly, so you might also want to run your radios from the lighter socket in your car (item 270-1533 is one example - about $5 each). Radio Shack sells several cords that might fit your radio (take the radio in with you). You can avoid this situation later by installing mobile radios in each car (these are wired directly to your electrical system).

Good luck on your move.

Actually, not a lot. But, in the ham newsgroups, there are representatives from both sides arguing the issue (and have been for months). The people posting are not likely to change their opinions, but perhaps someone reading the messages might be influenced (at least that is the common thinking).

Heck no. An antenna array that big would be bigger than my house, and certainly larger than my yard. I was lucky to get the antennas I have up. The guy wires are right up to my neighbor's fence.

But it is real tempting. I have been thinking about it. I don't really think my neighbor would mind a huge antenna array hanging over his house. I'll just tell him it is a large tv antenna. :-)

I don't think so.

Sure, there are HAMs here with 'attitude'. But there seem to be
more CBer's here with attitude that bait them.

Come on, you see it. The guys who intentionally post the BS
messages that are just really designed to pull the HAMCOP
guys out of the woodwork.

Yeah, there are some assinine HAMCOP people. But ignore
them and they go away, or at least are tollerable. There's a
hell of a lot more helpfull HAMs here that DON'T post as
HAMs, but you can tell they are. Maybe it's because of the
baiters waiting to pounce.

>Want the best? Get one of those big ass aluminum coils.
>

I know you are right warlock. We of the older crew here on this newsgroup have actually done this test several times. Perhaps the new crew and the 102" only crew should just try some of the tests and they will at least see for themselves.

> having a tech license.

Nonsense. There is no way that you can talk realiably for more than a few miles (especially during the day). With my simple base station in Bremerton WA, I can talk to people over an area starting at about Vancouver BC in the North going to about Portland OR in the South. That is a range of about 125 miles in any direction. And I can cover that range twenty-four hours a day, seven days a week.

Using repeaters, I can talk to people as far away as Boise ID, Eastern WA, and Southern OR. That is a range of about 400 miles. And I can cover that range twenty-four hours a day, seven days a week.

Because of that great range, I have just as many people to talk to as you do with your CB. While you are limited to talking to people within a few miles of your home, I can talk to people living over a much greater area. And just as many ham operators live in that extended area as CB operators live within a few miles of your home.

My wife, working in Seattle, can talk to me using nothing more than a five watt handheld. Her office is about twenty miles from our home. And, if needed, she can do that twenty-four hours a day, seven days a week - including the daylight hours when a CB handheld would be lucky to cover a mile. She is never out of touch when she needs me. And its free - no cellular phone charges (now that has to be worth something).

As for skip communications, CB cannot even begin to compare to Ham radio. And we won't even discuss the more advanced modes that you can't even use.

If you honestly think that the Tech license has nothing to offer, then you really are dumber than I thought.

> > I simply cannot understand why you would find that idea so objectionable.
>
> we dont want you urging us to do anything. would you like us to come to your

> and youll be able to do more???

If we were in a vegetarian newsgroup, and you had discovered something that would benefit others in that newsgroup, I most certainly expect you to spread the news.

But again, you're twisting the facts. You talk about forcing me to eat all my vegetables. How does that compare to what I am doing in this newsgroup? I am not forcing anything. Indeed, I don't have the power to force a thing. I post my opinions. You can either read them, or ignore them. You're not being forced in any way.

On a similiar note, some trucking companies have sent out memos about illegal radio equipment aboard their rigs, I was told at work to be on the watch and I am Ham so I drew lots of attention. (I work on an offshore oil rig). The FCC is probably behind it some way, A letter to a truck stop chain from the FCC would cause their legal dept (Larry the Lawyer) to recommend not dealing in anything which might carry a hassle. FCC types also travel they highways and byways and probably stop at truck stops to fuel up their RVs and spy in on how the other half lives.

It will be interesting to see how the FCC reorganization will line up. Who will do what will be the big question. Also watch HB2346 in Congress, need to write Mr. Tauzin (R-3rdLA) who chairs the Telecommunications Sub-committee about the why you think it should not pass. (small cities are lobbying hard for it).

Equipment For Sale 11/1/99

Siltronics Model 90 VFO -6
$70.00

HomeBrew Wattmeter Ikigawa large scale meter and case, Gold Line coupler, 20/200/2000 watt scale reads forward and reverse power $40.00

National NC46 Receiver, Immaculate internally, works perfectly, soemone repainted the cabinet and it shows brush strokes. Faceplate is a 7 on a 1-10 scale some silkscreening slightly worn. This unit is like new internally with manual $75.00

Shure 522 Dynamic desk Microphone, With High/Low impedence switch. A nice looking mic, better styling then the 444.
$60.00

Yaesu FT708R UHF handheld with PL. Drop in charger model NC-8, YM24A speaker Mic, GOOD nicad battery, leather holster,
$100.00

Sears road talker 40 This is the base/Mobile unit with the slanted face. 40 channel AM/SSB with stock mic.
$80.00

Siltronics 1011C, Recieves great, no 8950 in the final with manual, selling AS IS $75.00

Homebrew 10 meter amplifier , made from a military PA deck, homebrew supply, open chassis design. uses three 24 volt filiment versions of the 6146 tube.
$150.00

Yaesu FT23R 2 meter handheld with optional touch tone pad, receives but has intermitent TX. with original box selling AS IS $50.00

Bird SLug 5000W peak mode 1000W avg power 50-125 Mhz $60.00

Bird Slug 10,000W peak mode 1000W avg power 50-125 Mhz $60.00

Johnsom Viking Model 1 AM/CW transmitter with manual $150.00

Motorola UHF Power amplifier Model N1275A 450-470 Mhz $50.00

Browning MK III receivers and transmitters Abandoned project Sell the whole lot for $375.00 Email for details

Tram D201 in good condition with manual $300.00

All items do not include shipping from 93063 Zip code.
References available upon request.
Items shipped upon receipt of MO or after personal check clears
Pictures available upon request.

Then I'd give him the job of "Official Clock". That way I no longer have
to worry about the time. Let the "OC" tell us it's time, and then we can
all identify. Might make the guy feel special ;)

Arrogance is a personality flaw that has nothing to do with a person's
license class.

The fact is that anyone that decides to put forth the effort to get even
a tech license, is demonstrating a comittment that is just not there for

the type of people that ruin CB. They can just buy a CB and instantly
cause hate and discontent. Having to work for a ham ticket to do the
same thing, isn't worth it for them. It's not how much technical
knowlege that you have, but a willingness to COMMIT to something, that
weeds out the A*-holes.
>

Who will be soon annoying the adult locals in the area, by breaking in
every 5 minutes looking for his millionth radio check, or time check. We
used to go through what we called the "Christmas Syndrome". Every year,
at Christmas time, the band would be flooded with kids with new CB's.
Some became annoying, some gave up after a while, some became jammers,
and some became good operators. If the kids all have a channel that they
can hang on, then everything is cool. But if they just tune around, they
will just be problems for adults that have nothing in common with them.

The only negative feeling that hams may have for Cbers has to do with their undisciplined operations, and lack of respect for the rules. What CBers do on their own channels is not something that the average ham cares about. Believe it! Unless a Cber is either illegally on a ham frequency, or is running a really dirty splatterbox, and interfering with a ham band, most hams couldn't care less.

Hams try to "elmer" prospective radios people, including Cbers. Most hams would love to "upgrade" a CbBer, that shows promise, to the ham ranks. Now if the fact that some of this "elmering", which has much emphasis on rules and regs, bothers you, then maybe you can't handle ham radio. It's never meant as a slight toward anyone.

> those D&A and Swan amps to other CBers.....it was Hams.

In 1970, in my area (SE PA.), there were 2 channels that had any real traffic. By 1975, there were about 6 or 7. In 1970, most stations used call signs and mostly called their own base or mobile units. In 1973 there was about a 50-50 split between hobby users and "personal business" users. In 1976, there were about 80% hobby users. In the local town (Which became known as "bleed city"), there was at least one antenna on every block by 1975. But in this area, the explosive groth in CB was from between 1973 and 1977. My neighborhood had about a dozen Cbers in it (and 2 hams). Now there are only 2 of us that remain (and 4 hams).

But again, most people in the early to mid 70's never ran more than 150 watts on average. One guy had a Palomar Skipper 300, another had a D&A

Maverick, and another yet had a Wawasee 200 watter. Most of these were bought from local CB "garage dealers", or from Henshaws.

> conflicts.....At present there are about 11 channels out of
> 40 used by locals.

Agreed. There seem to be much less "Base Station" activity, while there seems to be an increase in mobile activity. I can spin the dial now, and hear activity on all 40 channels, but most of it is distant (less than S5). There is only one local AM channel (Where the signals are at or above S9), and 2 semi-local SSB channels (SSB covers a larger area)

It's funny, how, with seemingly less overall channel usage, how what's left can be so disruptive. Hardly a night goes by on the local AM channel, that there isn't at least one music player, a person trying to be an agitator, truckers just jumping on channel from 19 without even breaking, foul mouths etc.

I hardly believe that. There must be some infraction somewhere. It is NOT illegal to harbor a different opinion on ANY topic. There's nothing in part 97 that prohibits democrats, or any other political view, or any other topic that could not be considered obscene or indecent.

I made a CB repeater once. Just for the "hell" of it. Had too much
desense to be practical. The idea of 9 foot duplexer cavities, just
didn't sit well either.

We used to run FM on 26.675, about 12 years ago. Went there to "escape"
the skip noise.

>
> I actually prefer running a QRP station however I don't fault those that

> make a contact.

The real irony is that most of the time, the illegal freeband has much
better operators, than the regular legal 40. Most freebanders go there
to escape the riff-raff on the regular 40. Since it takes a little doing
(and more money) to get a radio that has extra channels, a common low
life won't bother. Much the same reason as they won't bother getting
into ham radio. The people who run on the freeband, for the most part
are either looking for better DX conditions, or are trying to get away
from the DX noise, so that they can continue to have local QSO's.

CB is *MY* band as well. The fact that I also hold an amateur license is
irrelevant to these discussions. When I speak about the CB band it is as
a CBer. I and many like minded CBERS, are sick and tired of those who
hold the rights of others in contempt, plain and simple. You keep trying
to deflect this into a "ham vs. Cber" arguement. This is not the case.
It's is more a "clean, decent, law abiding, respectful vs. selfish,
arrogant, scofflaw".

> >Someday, that "dork" may save your life, or may be the guy you have to

Like it or not, there will be times in your life where you will have to
deal with people who DO have authority over you. You have a choice, to
either grin and bear it, or suffer the consequences. If the thought of
working for a "dork" botheres you so much that you would quit an
otherwise good paying job, then YOU can live in a substandard lifestyle.

True story. Back in 1975, there were a group of us tennagers, who all
thought that our Sh*t didn't stink, and we ran on Channel 10 (right
after the truckers moved off). We thought that we "owned" the channel,
and regularly gave a hard time to any "squatter" that happened by. One
of the people that used to insist on doing battle with us, was an old
guy, who was trying to contact his base after work. One day the guy said
to us "keep it up, sooner or later you'll all have to see me, and then

we'll talk". We laughed at him, at his "idle" threat.

But we soon found out what he meant. Seems that this guy was the chief examiner at the drivers license center. He took the time to find out who most of us were (It didn't take much considering all the clues we gave out in our conversations), and when it was time to take the driver's test, it was payback time. Many of our group had to retest several times (I had to test 3 times).

So just remember, what goes around, comes around.....

Had the 13-700 1 watt version at during the same time period. Back then,
I could get 5 to 10 miles to a base station with that walkie.

The funny thing is that CB locals have dropped off drastically in the
last 15 years. There may be more mobile activity, and the background
chatter seems to be higher, but the amount of local base stations seem
to be in decline, at least in my area.

If the people that operated with foul mouths, and inconsiderate
behavior, were somehow removed, it would be a LOT nicer for those that
remained. Maybe then, we wouldn't need the extra power to get over the
idiots, or the extra channels to get away from them.......

I understand that. It's just MUCH worse when you add 1000 watts to it.
It's also worse if you "encourage" it. I usually turn up the squelch to
get rid of the skip. I don't call someone in "DX-land", because that
just starts the ball rolling. Next thing you know, a dozen people jump
in and want to work you or the other station. And then a dozen times
that dozen starts calling the other dozen and so on and so on..........

The other night, the channel was relatively quiet. I was talking local,
and I started hearing other local-sounding conversations. I knew the
skip was rolling, but so far it was just locals being locals. The next
thing you know, "Roger Redneck" comes in there with his overmodulated
splatterbox, and starts calling DX. Within 15 minutes the noise level
had jumped from about S5 to S9+, as other killowatt cowboys fired up
their rigs to see what was out there. The funny thing was, we were able
to hear 4 watt stations (at S5 levels), initially. But the yahoos had to
fire up big power to do the RF equivilent of shooting fish in a barrel
(with a REALLY big gun). The end result was that the channel's noise
level increased beyond the capacity to work 4 watt skip OR to talk
comfortable local. Totally unnecessary, totally inconsiderate, totally
selfish.

Different situation. If someone is attempting to physically harm you, you have the right to defend yourself, by taking whatever means to subdue the attacker.

In a "discussion" no one is threatening your life, so the analogy is flawed.

If a discussion cannot stay with the facts at hand, without going off into a name-calling tangent, then its value has diminished.

If you stay focused on the points and not the person presenting them, then you have a better chance of "winning" the debate.

Ham radio is a collection of FREQUENCIES. The "Geeky" aspect is
dependant on the PEOPLE that are on those frequencies. Get your license
and start a group of your own with "normal" people. That way you have
all the privileges of ham radio LEGALLY. If nothing else, that license
will hold the local cops at bay when they come knocking at your door for
disturbing the neighbors........

My wife got her license, and she's as non-technical as they get. She
just got tired of the "verbal groping" that she had to deal with on
CB....

Someone would have to be a real wing-ding, to look up a DX call, and travel the distance, just to "mess up" their home. Since I don't normally engage in "inflamatory" QSO's, people would have no legitimate reason to want to do me harm.

This "Identity Paranoia" seem very prevelant on the CB band. I've always chalked it up to the fact that most people run illegally in one respect or another, and have a need to "hide behind the mike", to make any law enforcement action that much tougher.

The real irony is that despite the steps that people take to "hide" themselves, a clever "sandbagger", can gather tons of information from just listening to conversations. I've listened to people, and just from their casual comments, I figured out where they worked, how many kids they have, how old they are, the general area that they live in (And simple DFing would narrow it down from there), they type of cars they drive, the make and models of their radio gear (And whether it's illegal) and so on. You don't have to announce your name and address for people, intent on finding you, to track you down.

You keep missing the point, so I will repeat it slowly for you once
again:

MOST OF US, THAT HAPPEN TO ALSO BE HAMS ARE ALSO CBERS, AND STILL USE
THE CB BAND, AND HAVE A STAKE IN THE DIRECTION THAT IT IS TAKING.

Because we hold ham licenses, does not meant that we cease to use, care,
or have a valid opinion on the direction, rights, and operations on the
CB band.

You need to let go of this "Ham vs. Cber" thing, it's getting old.

> very reason we stay on CB and you wont
> accept that as a reason from us.

Actually, I am fairly satisfied with where I am. I'm getting what I want out of ham radio at this moment. That may change in the future, but there is always time to worry about that then.

Again, twisting the facts, Tim. I'm not expecting you to seek my acceptance. If you have what you want, then more power to you. But that still won't stop me from talking about Amateur Radio, or urgeing others to check it out. You can either accept that, or ignore it. Heck, I ignore half the junk you say. I don't see any reason that you can't do the same.

Man, I live in Louisiana (Tauzin's area) so I have opinion (like a nose,
everybody got one!;). Brother Tauzin is being lobbied mainly by the Big
Cellular Companies so Ham and CB is small fries to him (I have spoken to
him about Ham Radio and his main interest is cellular) The local Hams
don't care for him and the CB crowd doesn't fit in real well with his
vision of communications for all (at $.30 per minute). Local towns here
are lobbying for the HB2346 due to a few Stupid people who run bad
radios, high power and knock out the cable system. I have already been
inspected for interference to the CATV system by the FCC so I know what
the term POLITICAL STROKE means.

160. List of the rec.radio newsgroups

Newsgroup: rec.radio.cb
Date: 1999-11-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7vki6v$p2l$1@news.hawaii.edu>
Source record: 8545
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and its content drifts further and further away from being "on-topic" in the various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

*It's been sadly reported that the moderator was lost to us in an automobile accident; the future of this newsgroup is not known. 73 Bill...

Your right!
There are a few of us that run amps but for the largest majority we just run some loud ass radios.
Even those of us with the loud assed radios are a minority though, most drivers just go out and buy a run of the mill Cobra, Uniden or Rat Shack radio with a mirror mounted fiberglass stick and are more than satisfied.
I used to be but now its a barefoot Galaxy 99 and a 2000 trucker or nothin for me.

The 150 mile restriction is useless what are you supposed to do if you are running your 4 watt station and you now have someone 5 states away talking in youtr radio like they are around the corner and they are running a legal station. I mean here we are on a worldwide band when the cycle allows it to and you are restricted to comm of 150 miles. It just shows how out of date, out of reality the FCC rules are.

A 3amp fuse should work, if it is a sideband radio go with a 4amp fuse, but no matter what do not put anything larger than a 10amp fuse in the radio if you care to save the radio if it is ever hooked up backass wards, the third wire is most likely a memory wire, I am not familiar with this radio, try to power it up without it, if you turn the radio off and back on, if the channel display stays the same and doesn't go to channel 9 when you turn it back on it might not be needed, if it goes to channel 9 when you power it back, you will need to feed this wire with a constant hot, is this third wire orange?

You're not losing anything by getting a ham license. And you are gaining a wealth of other capabilities. Anyone who would pass all that up just so they can use an illegal linear, and play with noise toys, is a damn fool.

>>>>That is a bold faced lie.

When you get a ticket, you stand a lot more to lose if you get caught doing anything that you enjoy on the CB band today.

Their is a lot to lose by getting a ticket, if you are not going to use the ticket to it's fullest.

More drivel by Dwight... The newly licensed expert on all affairs DC to Daylight.

Jesus, you are a newly licensed, newly educated amateur operator, aren't you.

> >
> > My opinion has to do with the fact that
> > instead of hams telling CBers to get
> > their ham licenses so they can then
> > operate with high power <snip>
>
>
> John, I seriously doubt that you will find many ham operators
> advocating that CB'ers get a ham license so they can operate with high
> power.

Then I suggest that you go to www.deja.com and search the archives and find out that one of the basic premises that amateur operators tell the CBers is that once they have their ticket, they can operate with HIGH POWER (being that the limit on amateur bands is 1500 watts for most classes and bands).

Your really opening your mouth and showing that you don't know the history of the newsgroup here, Dwight.

One of the basic priciples of proper radio operation is to use
> of as little power as necessary. That priciple is supported by
> regulations applying to virtually all radio services, including Amateur
Radio.

Please see the above.

>
> Instead, Amateur Radio is about learning the skills of putting
> together a well-constructed radio station that can communicate over
> great distances without the use of excessive power.

And the other school of thought:

Instead, Amateur Radio is about learning the skills of putting together a well-constructed, high power contesting station that is capable of completely obliterating all the competition that comes in its path, leading the user to the highest score over a weekend period. This will all be done with two hole Alphas, Henry's, and homebrew equipment using tetrodes with handles.

So, how is this different than channel 6?

>
> There are certainly occassions where higher power levels are required,

> such as EME communications (bouncing signals off the moon back to other
> locations on Earth).

And contesting, and the jamming that is going on on 75 meters, and the idiot
who thinks that they must OWN the local 2 meter repeater...

And the list goes on, and on, and on: For both services.

But, considering the losses associated with this
> type of operation, higher power is not excessive in this case.

Considering the losses that happen on sporadic-E skip, this would not be
considered excessive power when attempting to make a contact, would it?

Or, the other school of thought...

Well, they make an amplifier capable of 1500 watts, I can use it.

>
> But, other than these rare operating modes, high power is not really
> needed. For example, satellite communications over a range of several
> thousand miles can be accomplished with only a few watts (many have done
> it with nothing more than a 5-watt handheld radio in one hand and a
> small beam antenna in the other hand).

And many have done it with a megawatt of ERP using high gain parabolics or
multiple arrays in echelon, etc., etc., etc.

To each his own, but I don't hear you spewing this shit in an amateur
newsgroup.

>
> > And then, when the CB operator ignores
> > or disrespects the ham operator, the
> > ham operator can leave the newsgroup
> > and be done with it.
>
>
> John, as we have explained in other messages, we ("the ham operator")
> also use CB radios, so this newsgroup also belongs to us. Why should we
> leave just because we also have have a Ham license?

And why should the people who use CB radio strictly have to put up with the
arrogance that you are showing?

>
>
> > I'm sorry, but if every CB operator got a tech license and moved to
> > 2-meters, there would be exactly the same type of jamming and cussing,
> > and rudeness that is found on channel 6.
>
>
> You have made this argument before, but I don't buy it.

Why not?

Wait, I get it..

You REALLY DO believe that if someone has a ticket, they are better than someone who doesn't.

You arrogant little asshole. The truth has finally come out!

Would the
> problems increase if more people got a ham license? Most certainly.

But if a person was from 11 meters, and acted like an asshole, you don't believe that if they went to 2 meters they wouldn't eventually end up the same way?

I don't believe it from experience. I had a friend who went to General. Had a blast for about a year... Then his assinine behavior started up again, only this time it was on 2 meters, then on 440 when 2 meters began to become vacated.

Doesn't jive, Dwight.

> But I think that Amateur Radio can handle those problems.

Yeah, right.

Just like they are handling the Liberty.Net, right?

For one
> thing, there is no such thing as anonymous operation on the ham bands.
> The FCC has greater ability to monitor the Amateur Radio bands

Oh. O.K.... The FCC can't monitor 11 meters, but they can do a bang up job on 10, right?

and many
> ham operators have RDF skills.

So do many of the CB operators.

Antennas have been pulled down to prove it!

By the way, this explains why CB'ers who
> operate illegally on the 10 meter ham frequencies are located so quickly.

Right.

And they are busted, right?

If that was the case, their wouldn't be the epidemic that so many amatuer operators complain about now.

Take your fantasy world somewhere else. Amateur Radio is not the end all radio service. It doesn't even come close.

>
> Plus, most new ham operators quickly realise they have more to lose

> from illegal operation. In addition to the loss of operating
> privileges, there are serious fines involved.

Gee, and if you read... Those are the same fines that can be levied against
a CBer operating illegally.

For many, once they
> realise the benefit of Amateur radio, the potential loss of operating
> privileges is enough to prevent them from operating illegally.

That is plain BS.
Have a nice day.

Not necessarily...

Those whom you hear everyday are the bigger stations.

Just because someone hears me one or two days doesn't make me a superstar.

The fact that my station is consistent makes me one of the superstars.

Give me a break, Ive heard far more cussing on 2-meters than Ive ever heard on channel 6. And as far as jamming, I would like to see you jam 6, or any body else for that matter, This would only be a feeble attempt.
And what rudeness goes on here? This channel has been operating the same way since the 23 channel radio days. And I personally think it is pretty damn cool.

Just curious. Was the 5000 a Trucker center load type, or a base load mag mount type.
I use the 5000 Trucker on a 18" shaft with about 48" stinger on the toolbox, and really does its thing.

Joe,

What Rick and John John are trying to do is run all of the CBer's
(especially ones who talk on channel 6) off the band.
Not just 10 meters but 11 meters too. They cannot stand the fact that a few
of us get together and actually have a mutually great time. They are trying
to destroy what we (our circle of friends) have. Our competitions have been
around a lot longer than these lames think they have. Some of these guys
have been competing for 20 years.

You can go out there and wait all day long on your 10 meters and scan every
single frequency but you will not find any of us there. We utilize just one
channel. And it is within the legal CB band.

I don't blame you for wanting to get rid of the trashy CBer's. But why go
after the ones that are not hurting anyone? We have never bothered Rick or
John John. We don't go up on their precious channels and trash them. They
are a couple of Ham Supremist wanna-be-FCC-cops. After I read your post I
feel that you have some smarts in your head. Please don't go siding with
lames like these two who are out to get the world with John John's amunition
and his Rambo warfare. You seem to have more intelligence than that. I
feel the same way about the CB band and all the trash out there. Feed it
and it will get bigger. Starve it and it goes away.
I think I have said enough.

Thanks for the quick reply!
The radio does indeed have a channel 9 priority button on it, so you're right on target... I originally thought the wire was red in color (typical male color-blindness), but now that you mention it, it does indeed look orange. The white and orange wires are fused, the black is not. Should I start with the 3 amp, or should I go a 4 (and what voltage?)?

Thanks again for the help!

Hi, I have a Radio Shack scrolling L.E.D sign for sale. It has 5 programable message banks of 600 charactors each and an alarm message too. You program your messages in using the built in keyboard. It has 2 scroll speeds. The display is 1" high and 13" long. The whole unit is 3.5" high and 13.5" long. It can be used on the AC adaptor or the 12 volt lighter cord. I had it in my back window a few times letting people know what I thought of a local radio station that sucks and had a lot of fun and got a lot of attention. It is like new and sold for $179.99 new. Radio Shack no longer sells it. I am asking $80.00 + shipping for it. Please email me if you are interested. Thank you.......Doug

John,

You are obviously looking for attention here. I wont give you all the attention you want, though I will say this.

If a "troll" is one who is old, frail, and grumpy, then you might be a troll. If a troll is one that will foolishly write the commissioners of the FCC telling them they are not doing there job, when you should be writing those to whom the FCC get their fund from, you might be a troll. If you are someone who has no other life, then you might be a troll.

"Recently some buffoons...," spoken like a true (troll?) politician wannabe. Are we suppose to respect you with this type of opening statement. Get real Johnny!

>suffers the same black eye because most people have no idea of the
>differences between ham radio and CB radio. One is perceived by the
>public to be pretty much equal to the other. The public reads about

What does the public know about CB? They know what they use. Most (and I use that word hesitantly, due to higher percentages) people who use CB know that HAM is different. Perhaps not how different, but different nevertheless.

>individuals who behave as Flippo is alleged to have behaved, and gets
>the mistaken impression that this is how all Cb operators and hams
>behave. Thus my reputation is damaged, however undeservedly, by this
>perception on the part of the public. The same holds true for all

>I am sure there are many in both the ham and CB radio services who
>would love to try to repair some of the damage to our reputations that
>is done by behavior on the part of a minority of individuals who act
>as Mr. Flippo is alleged to have acted. We would like to help clean up

Im sure many CBers would love to act to keep those HAMs running illegally on the 11 meter band off also. Oh well, no mention of any HAM license holder irresponsible and illegal "alleged" actions.

>the Cb band so that it can again be a radio service that is useful for
>the purposes for which it is supposed to be used under Part 95. I
>therefore pose the following question to the Commission, on my own
>behalf and on behalf of other CB operators who operate our stations
>legally and considerately: How can those of us who operate legally
>under Part 95 help to rid our band? When confronted with the behavior

Johnny boy!

I have noticed you make associations with guns a lot. I am of course, just for my own humor, recording all those that make reference to guns. Now, you will see a troll my friend.

No, I for one am afraid that a gun using threatening pathetic hostile psycho such as yourself, would come to my home, with a weapon that could be conceived as life threatening. Then I would have to possibly.... well. You were right before, perhaps taking it to another group would be a good idea. Threaten me just a little John, but if you do, be sure to act on it. Im sick of recording your empty threats.

And why not Johnny? I say burn him at the stake! One foot is one foot, just as one watt is one watt, just as one percent of modulation is one percent, one decibel, blah blah. Damn you are just a hypocrite aren't you?

Thank you, thank you for running legal. Come give me a kiss now.

As I put force on the hammer then squeeze tight, I smell powder and loud sounds and then a red goo leaks. Take care.

Well....here I go, setting myself up to get flamed, but.....
I was reading the posts about dealers with bad attitudes
and I normally don't post cause I get flamed and beat
every time I do, but here goes cause I can't keep quiet about
this topic. Here are some of the reasons I as a dealer have a bad attitude.
You show up at my house, when the shop is closed, regardless of the
day of week, or hour of day (I've had people come after midnite and think
nothing of it) to drop off a radio or ask questions.
You always want your radio repaired before everyone who was
before you, because we've done business together so long.
You always think I charged you to much.
You always want to buy your radio for below my cost.
Just several reasons I have a bad attitude.
Last but not least, everytime I poke my head up in the NG I get
flamed or blasted for my opinions.
Just one man's opinion, and not to say there aren't a lot of people
I really enjoy dealing with, and a lot of good people in this NG.
CTS

>one missing something here

I hate to call anyone a liar, but I really doubt you talked mobile to mobile,
AM on CB from NJ to Hawaii. The propigation properties of the 11 meter band
(and the 10 meter band) just don't allow for that. It is not possible for the
signal to make it at night because of the atmosphere. I think perhaps you were
duped by someone telling you they were in Hawaii..

Are you sure when he told you he was on the big island, he wasn't refering to
Manhattan?

Channel 55 (27.555) is patently illegal for CB use in North America but
it sure doesn't stop the Freeband DXers!

This last couple of weeks have heard the band from 27.415 to 27.995
going nuts.
I've *heard* myself stations from all over western Europe and western
Asia. The best times seem to be between about 9Am an 12Pm.

Uh, you better rethink that, when the 11/10 meter bands are open, as
they have been very often lately, it is easily possible to work those
distances with low wattage, on mobile antennas, and AM. Two or three
watts or even less, can get you halfway around the world with s-9+
signals under the correct propagation conditions. I have done it on
10-meters many times.

You may want to throw some money at your rig and antenna first. A better antenna will make more of a difference than adding an amplifier. Also check that your SWR is good. It sounds like you have a power mic so maybe you've got some clue as to what you are doing. Have you considered that maybe the stations in the background are ignoring you? By that I don't mean to be rude, but there are some really cliquey groups on the CB that ignore everyone that isn't one of them. Also, lately there has been a lot of DX coming in so the noise floor on the band has been high. If you have a good radio and a good antenna then I think you'll find that there are a number of good amplifiers in the 100W-250W range. These are illegal for use on CB in the USA, just in case that is a concern of yours. I gather the Texas Star units represent good value.

Every time you double the number of antennas, you half the power that each antenna receives. Think about it, you have to. The interaction between the two antennas suppresses the signal in certain direction(s) resulting in gain in the remaining direction(s). So if you extrapolate this, you can see that a 1/4 wave antenna is every bit as efficient as the most ambitious, multiple co-phasing arrangement you can think of.

Doubtful.

Nothing is going to offer you protection from a direct hit. A good ground will lessen the chance of damage from a nearby strike. The current from this strike can be induced into your antenna system from quite a distance away - and I mean half a mile here. The general rule of thumb is for every 80 ft you go up, you are doubling the risk of being hit by lightning. The best way to ground your station is at the base of the tower with a 8ft copper rod. Use flat, ribbon conductor from the top of your tower down and don't forget to ground the shield of your coax near the antenna. This is easier said than done on braided lines. You could use an SO238 connector and a jubilee clamp here. I would not recommend grounding your station in the house as this will give a surge an alternate path to ground - inside your home.

I've seen it many times on this newsgroup. A ham and a CBer get in an
argument over the CBer running an amp, the argument always ends up
with the ham telling the CBer he should just get his jam license if he
wants to run power, otherwise he shouldn't run illegaly on 11-meters.
Hey, I agree with this statement, but the person is already running
high power and telling him/her to get their ham license as an
alternative to running illegaly on 11-meters is just a waste of time.
If they were so inclined they would have already gotten it!

>of as little power as necessary. That principle is supported by
>regulations applying to virtually all radio services, including Amateur Radio.

I never disputed this statement.

> Instead, Amateur Radio is about learning the skills of putting
>together a well-constructed radio station that can communicate over
>great distances without the use of excessive power.

No doubt.

> John, as we have explained in other messages, we ("the ham operator")
>also use CB radios, so this newsgroup also belongs to us. Why should we
>leave just because we also have have a Ham license?

If the ham operator can contribute something constructive to the
newsgroup then by all means stay. But, if the ham is going to
continually argue with the CBers about how they should stop running
illegaly on 11-meters and just get their ham license, then they should
probably stay away because this argument is not going to go anywhere.

> You have made this argument before, but I don't buy it. Would the
>problems increase if more people got a ham license? Most certainly.
>But I think that Amateur Radio can handle those problems. For one
>thing, there is no such thing as anonymous operation on the ham bands.
>The FCC has greater ability to monitor the Amateur Radio bands and many
>ham operators have RDF skills. By the way, this explains why CB'ers who
>operate illegally on the 10 meter ham frequencies are located so quickly.

I totally agree, but if the scenario occured on 2-meters like I
stated, I don't think there are enough ham operators around who could

monitor and control the millions of abusing radio operators. For every offending operator that was tracked down, there would be 1000 more right there to take his place. This is totally hypothetical, and I know it could never happen, but you can understand my example.

> Plus, most new ham operators quickly realise they have more to lose
>from illegal operation. In addition to the loss of operating
>privileges, there are serious fines involved. For many, once they
>realise the benefit of Amateur radio, the potential loss of operating
>privileges is enough to prevent them from operating illegally.

Hey I agree. I don't have a thing against amatuer radio. I also don't have a thing against CB and I also that 11-meters has emerged into a very unique band.

Okay, I guess I should clarify my statement. I myself do not think of the people on 2 meters as geeks. However, the general public, I'm certain do. Just as people who work on computers all day are considered computer nerds.

I see licensed amatuer radio more for people who would like to discuss scientific topics, although some certainly talk about the corns on their feet. And CB more for people who just want to talk, shoot the breeze, or make contact with each other.

Thats not true. The FCC simply meant that you should not key down
your mic all day long saying "Skip land, skip land, how 'bout ya skip
land. This is..."

Obviously they knew that people would occasionally be able to talk
over the distance limit. They just didn't want people being hugely
annoying to other citizens trying to use the band.

Well, I find it very hard to believe that anyone could make a contact like that
on *AM* on CB with those distances.

My guess is the third is the memory wire. It should be connected to that battery

all the time. All this like does is save information in the radio. This in only
a guess mind you. I would have to see it for myself.

Well....here I go, setting myself up to get flamed, but.....
I was reading the posts about dealers with bad attitudes
and I normally don't post cause I get flamed and beat
every time I do, but here goes cause I can't keep quiet about
this topic. Here are some of the reasons I as a dealer have a bad attitude.
You show up at my house, when the shop is closed, regardless of the
day of week, or hour of day (I've had people come after midnite and think
nothing of it) to drop off a radio or ask questions.
You always want your radio repaired before everyone who was
before you, because we've done business together so long.
You always think I charged you to much.
You always want to buy your radio for below my cost.
Just several reasons I have a bad attitude.
Last but not least, everytime I poke my head up in the NG I get
flamed or blasted for my opinions.
Just one man's opinion, and not to say there aren't a lot of people
I really enjoy dealing with, and a lot of good people in this NG.

What a bunch of crap. There is no way you have contacted that many
countries with the equipment you describe above.

Prove it. I want to see QSL cards from those 112 confirmed countries
you claim that you have contacted with 25 watts and an A-99. I want to
see a verifiable identification on those QSL cards (yours and the
sender). In other words, don't go around downloading QSL cards off the
internet so you can fill in your name and claim that they are your QSL
cards. I want to be able to contact the sender for contact verification.

In fact, I'll accept just _FIVE_ QSL cards from anybody overseas, with
a verifiable radio license, that will say that they have made contact
with you on any frequency between 25.0 MHz to 28.0 MHz. I doubt that
you have made even one overseas contact, so I really want to see that
five out of the 112 you claim.

You can claim anything you want when you are operating illegally and
therefore have no way to verify it. Heck, I can say that I've talked to
500 countries with my five watt CB handheld with nothing more than the
stock rubber antenna. Of course, its a bunch of bulls**t. But no more
bulls**t than you are spreading above.

You're a troll, Tim. I once thought you were something more, but
you're nothing but a troll. You're credibility just went out the window
with the claims above.

In answer to all that above, she can simply switch to any one of the other nine repeaters that she can contact from her office. If a repeater goes down, no problem. Again, reliable communications twenty-four hours a day, seven days a week.

I'm going to add a little more to this. She rides the ferry between Seattle and Bremerton every day. Towards the middle of the trip, there is a four or five mile area where cellular phones are useless - none of the cellular towers cover this area (it seems they were thinking about land use when they installed the towers).

My wife can just keep right on talking while all those cellular phones go dead. Her 2 meter handheld has more power and can hit the repeaters easily. Again, reliable communications twenty-four hours a day, seven days a week (even where cellular phones are useless).

> Been there, done that. The tech license is a beginners license. I have
> done more building, experimenting (antennas, not included. I do more with

Again, what is your point? I've played with a lot of radio equipment also (including the CB equipment I had as far back as the mid 70's). Nobody has to give up CB radio when they get a ham license.

Why do you keep thinking that people have to choose one radio service over the other? People can have both and enjoy whatever they want in either. Even you claim to have tried both. So why is it so wrong for me to urge others to try it so they can judge for themselves if Amateur Radio is right for them?

Are you sure that you're not a ham radio operator that hates CB'ers and are trying to keep them out of "your" Ham bands?

> If you don't like CB, then go away.

I'm not going anywhere. If you don't like what I'm saying, then you go away.

Took a look at that page. It's not quite what I have in mind. What I have in mind, is to be able to use my copy of "Street Maps USA" which will provide latt and long for just about any city, town, and backwater in the US to find that information for whoever I'm currently talking to (or at least listening to while they work other stations) and feed that data into a program that is live on my desktop (not refer to charts on paper and then have to guess at the heading if thier location isn't on the chart). I've been working on the program already and have made a good bit of progress and have learned a good bit in working on it. Right now, it accepts the input of my coordinates and the target coordinates (which with the aid of the before mentioned map program can be as accurate as the other party is willing to provide by telling me where they are, even down to street intersections) and it calcs the heading and distance for anywhere in the world as long as the points entered aren't on opposite sides of the equator. The formula I was able to locate on the web returns devide by zero errors if the heading has to cross the equator. However, as I am only a CBer it would be by pure luck that I was able to work such a station anyway. As the program is intended for my use anyway, and I'm not likely to need calcs beyond my northern hemisphere, I think I can live with that weakness until I find a better algorithm.

And, as you well know, Amateur Radio operators can legally use 1500 watts, Toll. But that does mean they SHOULD use 1500 watts everytime they open there mouths. And there are rules to that effect. But I already said all that in the message you quoted. You were just too busy trying to twist the other things I said to notice.

> To each his own, but I don't hear you spewing this shit in an amateur
> newsgroup.

I don't need to say any of this in an Amateur Radio newsgroup - it is already covered by the study guides for the tests required to get a license (so every ham operator already knows it).

> > You have made this argument before, but I don't buy it.

> You arrogant little asshole. The truth has finally come out!

What truth, Toll? Certainly not anything you say.

You ask above why I don't buy his argument? I explained that in the message you quote from - no anonymous operation on the ham bands, FCC has greater ability to monitor the Amateur Radio bands, and most new ham operators quickly realise they have more to lose from illegal operation.

But, of course, you know that. You spent the rest of your message trying to challenge each one of these assertions.

No place in my message did I even suggest "that if someone has a ticket, they are better than someone who doesn't." Those are your

words, Toll. I have never said that in any message I have ever posted to this newsgroup, or any other newsgroup.

Boy, you really do get excited by all this, don't you? I'm sorry if I've said anything that would cause you to degrade yourself by using such crude language.

> operators complain about now.

Yes, they get "busted." Read the November issue of Popular Communications magazine (pages 66 through 69). It talks about a "CB Freebander" who was recently fined $20,000 for "willful operation of an unlicensed radio station on 28.375 MHz, willful or malicious interference with an on-going amateur radio communications, and failure to make his radio equipment available for inspection by an authorized FCC representative."

The article states that the "CB Freebander" was discovered by Amateurs using "radio direction finding" and "close-in monitoring." The evidence also included audio tapes of the individual's transmissions.

The basic conclusion of the article - stay away from the Amateur Radio frequencies unless you can afford to lose $20,000 each time you're fined.

There is stepped up enforcement throughout the Amateur Radio bands. Anybody (and that includes Amateur Radio operators) who uses these bands improperly can face very stiff penalties.

By the way, this goes back to why I don't buy his argument mentioned earlier in this message. This increased enforcement is still another reason why I don't think his argument is valid.

I've pretty much decided to write my own. Once, a couple of years ago I saw a program that sort of did what I want. The only problem with it is it had no means of entering latt and long manually. It had a global map, rather small, and you entered coordinates by clicking on that map. You had to guess as to the location of the city in question. As I do tend to be mildly obsessive compulsive, the idea of guessing irritates me unless there's no other way around a problem. I realize, that even with the most accurate calculations, a beam heading will be approximate at best due to the effects that everything from buildings, mountains, electromagnetic anomalies, etc can have on the way a signal travels. I use a set of stacked three element yagi's. Stacked antennae, have one strength/weakness in that their main lobe is much narrower than that of a single antenna, requiring more accuracy in aiming the beam. As soon as my rotator is ready, it's in the shop for an overhaul as it was in service for nearly 20 years straight b/4 I obtained it, I'll be aiming the beams as close to geographic north as possible by using magnetic north, then compensating for magnetic declination to get geographic north.

Anyway, as I sit here listening to my closest neighbor's ignition coil on my CB Channel 13, I realize that it's time for me to start getting ready for work.

Later

Man, than I'm really in trouble - both radio and computer. :-)

> I see licensed amatuer radio more for people who would like to discuss
> scientific topics, although some certainly talk about the corns on

> breeze, or make contact with each other.

Thats why Amateur Radio is so great - there is enough room for all.
There is room for the people who what to debate the use of bakelite
insulation versus plexiglas insulation on variable capacitors, or the
benefits of using Romex cable over number 8 copper wire in a grounding system.

And there is room for those who just want to sit back and have a good
conversation about whatever fits their fancy at the moment. There are
at least 50 repeaters within the range of my base station. Every night
there are discussions relating to just about everything.

If I get bored with that, I can drop down to the simplex frequencies.
Or the SSB frequencies. Or the packet frequencies. Or I could even try
another band.

I'm also the communications officer for the local Coast Guard
Auxiliary Flotilla, so I could pop over to the C.G. frequencies to see
what is going on there (my radio was legally modified to operate on
these frequencies - MARS/CAP/CG mod).

Or I can turn the whole thing off and see what is happening on the CB.

Talk about radio heaven. I don't have enough time in the day to cover everything.

Well, enough preaching. Take care, John.

Just because you can't to it with your trusty HT doesn't mean that a CBer can't, either.

Please see below:

> > why dont it compare? when CB was a ham band it was the most productive band

>
> What a bunch of crap. There is no way you have contacted that many
> countries with the equipment you describe above.

Why not? Skip to Europe is not uncommon at all on the east coast and from Texas... I have done it with an export radio and a pair of Van Ordt Power Stick antennas.

35 watts PEP, 5 countries in about 15 minutes.

If you think it don't happen, you better pass the code and play with 10 meters. Your total lack of understanding beyond what Gordon West taught you is showing agian.

>

> cards. I want to be able to contact the sender for contact verification.

So, in other words, you want to see an Alpha Tango directory.

If you would open your eyes to the rest of the stuff that is posted in this newsgroup, you would see that DXpeditions are scheduled, people run scheds, the whole 9 yards.

Just too much for you to comprehend that a bunch of CBers do this, when you didn't know about it, and had to get a ham license to ATTEMPT to do the

same.... Maybe you should go all the way and get that Tech Plus ticket!

>
> In fact, I'll accept just _FIVE_ QSL cards from anybody overseas, with

I will accept 5 people with verifiable radio licenses operating illegally.

Found a way out with wording, didn't ya Dwight.

Don't try to be a lawyer. People here won't cut you any slack. Your acting
like an ass, and we will call you on it.

>
> You can claim anything you want when you are operating illegally and
> therefore have no way to verify it.

And you can claim anything you want when you don't know what you are talking
about... And that really seems to be the way things are going around here.

The no coders come to rec.radio.cb They tell the whole world that all the
CBers that operate on the "freeband" should ceast and desist and run to VHF
where they will be legal.

Sorry, but the whole world doesn't fall to the drivel on the ARRL.

Heck, I can say that I've talked to
> 500 countries with my five watt CB handheld with nothing more than the
> stock rubber antenna.

That's real believable.

Of course, its a bunch of bulls**t. But no more
> bulls**t than you are spreading above.

Right.

So, then your saying that you would rather rely on other peoples equipment.

O.K., I guess for the technically challenged, that would be the best.

If a
> repeater goes down, no problem. Again, reliable communications
> twenty-four hours a day, seven days a week.

Right.

Sorry, I have been in the outback of Southern Utah when repeaters go down.

As a matter of fact, we had an entire site go down, taking all the local
repeaters.

Not uncommon, either, when you consider that the amateur radio repeaters
usually share tower space and electricity with other licensed services.

Who do you think is going to win for precious generator power when power
goes out at a mountain top site?

>
> I'm going to add a little more to this. She rides the ferry between

I didn't say that a well-grounded metal pole would achieve "a better match." I said "best PERFORMANCE can be achieved by installing the antenna about forty feet in the air on a well-grounded metal pole." I don't know how I can say that more clearly.

As for the need for a well-grounded metal pole, virtually all antenna systems require a good ground for best performance (certainly this antenna does). Unless you run a wire down from the antenna mount, the only way to achieve that ground is through the metal mast.

And, as for guy wires, of course they have to used with a metal pole. Therefore, I didn't think I even had to mention them.

> > The GPK-1 ground plane kit will slightly improve line-of-site

> and how will this lesson the performance in DX?

Experience, Kavorkian. That is how I know the GPK-1 ground plane kit will "slightly improve line-of-site distance, but will slightly decrease skip performance." I have been using this antenna for years, both with and without the GPK-1. And you probably already know that I have this antenna right now.

Hand held radio's serve a purpose outside. You will not be able to communicate with just the radio inside a car. You will need to attatch an outside antenna, mobile or base to the unit to talk. It will work as well as any stock radio will work.

Depends on who you have around you and what you have around you if you will be heard. Good luck. They were designed to be used in the woods.

Joe,

I read your post, and you seem like a pretty smart dude. Use some of those smarts and don't just jump on the popular, all cbers are evil, bandwagon. I promise you that for every 1 badly tuned, splatter box, out of band talking butt muncher on the CB there are thousands that run clean stations. Among those thousands that run clean stations, fully two thirds to three quarters of them run high powered equipment.

An amp on the CB is like a sports car on the highway. Some people fly down the interstate, barely in control of thier car, endangering everyone. Most, however, fly down the interstate in complete control endangering no one. It is pure stupidity to even attempt to write everyone who exceeds the posted speedlimit a ticket. Those who advocate such tend to be angry and bitter because they cant spend the $$$ to afford such a nice ride. The same holds true for many of the whiners who advocate eliminating amps from the CB. They can't afford the $$$ to obtain well built clean sounding equipment (or modify thier existing equipment to make it so) and they're bitter and angry about it. That's the same mentality that has led to our public schools being the laughing stock of the world. We spend more $$$ per student than any country in the world, yet out public education system lags behind in nearly every measurable way. Why? Because those who aren't intelligent enough to make good grades hold the rest of the students back. They do this by calling high standards unfair and bitchin and whining about them until the standard is lowered. Once the standard is lowered, they can feel good about themselves because no one is making better grades on average than they are. On the same token, eliminating all amps from CB will lower the bar, so that those who do not have either the will, or the $$$ to do better can feel good about themselves because they don't have to listen to better sounding, clean, loud radios which make their equipment look and sound like the junk it is.

As far as talking out of band. Again, I say that those who do so are an ultra small minority. It just seems like there's a disporportional number of outbanders from CB because the outbanders are the ones you hear bleeding on your 10 meter band and because even if outbanders made up only 0.5% of the users of CB they'd quite probably come near

to outnumbering hams in sheer numbers. I'd be very surprised if there was a non-ham house in the US that doesn't at least have an old CB in the attic left over from the CB boom in the 70's. If you want some proof that the vast majority of CBers remain within their forty channels take this into consideration. We'll use my equipment as an example. I run a set of stacked three element yagi's made by Hygain. This antenna, typical of most CB antennae isn't designed to be broadbanded. SWR starts to climb fairly rapidly if you get outside the 40 channels. My antenna is tuned toward the lower end of the CB spectrum because that's where I stay most of the time. As a result my swr climbs faster on the h igh end than on the low end. Just to see what happened, I checked SWR above 40 and it got above a 2 at around 27.655, still plenty far enough away from 10 meters to not bother anyone. I, and I feel like most people who run amps feel the same way, find tubes to be too expensive and hard to find to be risking them by transmitting with such high swr. As a result, even if I wanted to key up there, I'd definitely be low power. The 6LF6's in my amp are way too hard to find. On the low end of the spectrum I can get as low as 26.255 b/4 my swr's start climbing to unacceptable levels. This being the case, probably with most actual cbers, I postulate that all of the people who are actually opeerating illegally on 10 meters aren't CBers at all, but pirates who've modified CB equipment, especially the antenna, to the point that it isn't CB anymore. Go after them, leave the real cbers alone just like we leave you alone. CBers are picked on enough as it is. Even a completely legal CBer will always lose if he' s bothering someone's TV or phone, something that is easy to do given the low quality of consumer electronics sold these days. Yet, a ham license offers you guys protection and some imagined air of authority in the eyes of individuals, and the FCC will back you guys up when someone complains against you.

I know that. But at least in our case, the repeater is sitting in one
of our homes. If he shuts it down, it will be by the off switch.

Our repeater also mutes DTMF tones, so that in order to "capture" them,
you would have to be in range of the input signal. We also have a
control link that is on another band, which is the prefered way of
"doing business" with the repeater. There are no tones rebroadcast on
the output.

Well, now you do. Our 220 machine is at the home of my co-owner (Who
happens to be 500' ASL). While we can turn it off with DTMF tones (Which
do not get rebroadcast over the output), he has the option to just flip
the switch.

> more illegal CB activity in your area of NY in the 70's than there is right
> now.....why the all the NEW concern?

Wrong. Plain and simple. While here may have been a handful of
"experimenters" back in the 70's, who had a few extra channels, or a
little "footwarmer" under the bench, these same people weren't on the
air cussing, jamming legitimate QSO's, playing musical noise toys, or
(over) using echo mikes. That is something that has gotten out of hand
in probably the last 10 or so years.

Again, remember, it's not the guys who run responsible power, it's not
the guys that run freeband DX, it's not even the guys who get together
and have fun at keydowns. It's the "people" that have no respect for
common decency, and other people's rights. THOSE are the ones that are
ruining CB.

I'm not so sure. I've had a discussion with another ham about how great the internet is, and how much better is is for communicating than ham radio. He spends most of his time on internet phone, and video chatrooms and such. Yes, you can connect anywhere in the world with the internet, and do many things that you can't easily do on radio. But to me, radio is more fun, becasue it doesn't involve a phone line.

This same ham was demonstrating how he can listen to radio stations over the internet and play CD's, and to me it's more like" Gee, you've just shown me a $2500 radio and CD player, wow!"

That same problem exists on the internet as does on CB. The lowest common denominator can get on the internet and ruin the fun of many other people, simply because the internet is easy to access. There seems to be an ever increasing number of anti-social, deviate people in this country. Maybe they should've had a good spanking instead of being sent to "time out"(What a ridiculous concept IMO), when they were kids. Whatever the case, as long as these people are attracted to public forums, they will do their best to wreck any harmony and order that may exist, just for their own pleasure. Other people's misery is their pleasure. I have no tolerance for people like that.

>

The thing is, you can tolerate most skip interference from legal power stations. I have rarely seen the S meter climb above S9 while legal stations skip in (Usually it's between S5 and S8). It's when the "big guns" fire up, I get +20 over signals, and the noise level rises to S9 or more.

That's why when I used to work DX,(Many years ago) I'd go for the cleaner outband channels. While the "Kilowatt Kowboys" battle it out to work a few states,on the regular 40, I used to work South America, Italy, Europe etc, with 25 watts SSB on the freeband.

The FCC distance rules are useless on a band that permits worldwide DX. The CB band should have been assigned somewhere above 50 MHZ (Maybe in the 72-76 Mhz space). But that's water over the dam now.....

> Yes, they get "busted." Read the November issue of Popular
>Communications magazine (pages 66 through 69). It talks about a "CB
>Freebander" who was recently fined $20,000 for "willful operation of an
>unlicensed radio station on 28.375 MHz

1 out of a million!!!! wat to go riley!!!!!

> The article states that the "CB Freebander" was discovered by Amateurs
>using "radio direction finding" and "close-in monitoring." The evidence
>also included audio tapes of the individual's transmissions.
>

just in case you didnt know that case happened right here in Toll and i's back yard. were familiar with the case. the guy was caught because he was a ham not just because hes a freebander. we have many freebanders and amp users here in houston that the FCC didnt give a shit about when they busted that guy.

> The basic conclusion of the article - stay away from the Amateur Radio
>frequencies unless you can afford to lose $20,000 each time you're fined.

the guy was using 27.535, and 27.370 or something like that. he wasnt on two meters.

> By the way, this goes back to why I don't buy his argument mentioned
>earlier in this message. This increased enforcement is still another
>reason why I don't think his argument is valid.

this increased enforcement is similar to the war on drugs. its all fantasy and public relations by the FCC.

i tell you what toll. this guy is a real ass. i'm gonna call him on his bluff. 112 is impossible? what about my friends in europe with over 200. i'll pick out my best 5 and send some photocopies on there way top mr dwight today. maybe we'll have a new freebander dxer on our team. ps if you want toll i have the 99 AT and SD directory on a text file that i can send your way. theres about 6000 members listed for both groups. just let me know.
ps. dwight when you get the photocopies in the mail your ass better come to this group and admitt i was right. and if your thinking about sending them to the fcc i dont care about that either. i'm already listed in the directories of so many groups already. you should follow the links on my signature and see what the dx is all about

I agree with everything you stated 100%. A few things you forgot to add were the questions they have about items they have bought from some other CB shop that the CB shop was unable to answer because they just sell things, and if the product is any good!!! When you ask them why didn't they come you in the first place they have a million excuses as to why they didn't. My policy is now - I will be happy to answer all questions re. items purchased from me ONLY!

These were public address system microphones used in schools and the like. They are dynamic mic's which when attached to a radio with a built in preamp, dont sound too bad. They should look just like a Turner +2 preamp desk mic (with the shark fin on the top).

Just build yourself a 1/8 wave directional loop antenna (in the shape of a lollipop) and spray one side (1/2) with Teflon spray. Then just follow your S-meter for peaks. When you get close to the area, start reducing your RF gain. When you get in the neighborhood of the subject, disconnect your antenna from the back of the radio and raise the RF gain to the max. As you get closer, reduce the RF gain to zero. Once you get peaks with the antenna disconnected and the RF gain at zero, you should be within a few houses of the party you are trying to track, which all you have to do is start looking for antennas on roofs.

If you really want to get technical, you can build a couple of "Active" antennas which use triangulation to determine the location of an emanating radiowave. (This is the method the FCC uses along with aerial photography)

>Incidentally, they DON'T ship converted radios, they are all 10 meters, and....."
Up until THIS Year they used to allow "anything" in if it was a 10M radio, as long as it didn't have 11 in it. But I have seen the FCC citation given to the Truckstop in Maryland 2 weeks ago. The fcc now considers (they put this in writing) most 10M rigs as "designed for primary operation as a CB", and as such they are taking the attitude that they are non-type accepted CB equipent. The truckstop was cited for NON-Modifyed 10M Galaxy radios. They(FCC) also mentioned in the citation specifically that they tested the RCI 29XX series & Galaxy 10M radios in their lab & found them to be "designed for & easily convertable to" CB radios. They seem to be using the premise that the rules state "Equipment designed for" Citezen's Band use must be type accepted as a CB Radio & they are now interpreting that to include most current 10M rigs. In a related incedent earlier this year, the FCC would not allow a shipment of Mirage RCI-2950's into the country, using this same logic. I think the Mirage people here are starting to use the name "VIRAGE" on some radios since this incident so as not to "flag" anything looking for Mirage on the packing lists.......
Things are going to be changing.....

Are you working out of your home? If so, you're going to get that no matter what business you're in. Try isolating your business from your home and treating your customers more like business customers. Here are a few things I've tried, or seen other try.

First of all, isolate the business from your home. Put your business in a separate building if possible (a garage, shed, etc.). Put a big sign on the door with your business hours. And never handle customers after business hours (simply say that you are closed).

If you can't move out of your house to another building, at least give your customers a separate entrance and again put a sign on the door with the hours. Put a sign next to your front door (the private entrance) saying something like, "customers - use side door."

In either of these cases, never take your customers into the private living area of your home. They are your customers, not your friends. Make sure your customers understand this relationship right from the beginning - your home is for friends, the business location is for customers.

And make sure your friends, who you don't mind helping after business hours, understand that you are doing it just because of the friendship. Tell them that the rules still apply to all other customers (including their friends).

In your business location, establish clear separations between yourself and your customers. Put up a counter, and don't let customers behind the counter (another sign will help here - including a plastic chain across the entrance).

If you repair equipment, don't let your customers into the shop area. Place it within view of the customer, but make them wait on the other side of the counter while you work on their equipment.

Don't let your customers know that you work on equipment after business hours. If a customer comes in five minutes before closing, take the item and tell them that you'll start on it the next morning (even if you do repair it later that night).

And never work overtime on any customer's equipment. If you don't respect your business hours, how can you expect your customers to respect them? When it gets close to closing, tell the customer that you're not going to be able to finish it today, and that you'll finish it tomorrow.

I would even recommend dressing differently while at work. Put on a lab coat and wear a name tag. When it is time to close, taking off the name tag, the coat, and slowly turning off the lights, is a good signal to your customers that it is time for them to leave. Beside, dressing for business presents a more professional business image.

If they still hang around, waiting to walk back to the house with you, after you exit the business and lock the door, now is the time to be blunt. Say something like, "thanks for stopping by. We'll see you tomorrow. We open at 8am."

Establish fixed prices and post them in clear view. If you sell equipment, and have samples, put them in a display area with the prices clearly marked. For your repair prices, post prices for common repairs on the wall behind the counter. And stick to those prices for all customers. Most customers will only ask for a discount once. If you don't give in, they will seldom ask again.

Also remember that your customers, in a radio related business, talk to each other on the radio. If you give one customer a special price, he is going to tell everybody he knows, and they are going to expect the same price. If you give a friend a special price, make sure he understands that - give him the price for regular customers and ask that he not mention to price you gave him to others.

The same applies to your regular prices. For example, if you charge one price for a repair today, you cannot honestly expect your customers to be happy if you charge them a different price tomorrow. Item sales is a lot easier. Raise your prices with your purchase cost, and explain to your customers why the price went up when asked (your price went up, so their price went up).

If you truly establish yourself as a business, it will make it much easier for your customers to accept the prices you charge. After all,

people don't usually argue with WalMart over price, do they?

All of these things work. Several people in my family are
self-employed. For example, my mother has been working out of her home
for more than twenty years. I learned most of these things by talking
with them (I plan to run a business out of my home one day).

In the days before SSB, hams did it all the time on 10 with AM, and if
you can do it on 10 there is no reason you can't do it on 11 meters. I
once worked a guy in Hawaii on 10 meter AM and he was using a
walkie-talkie running 3 watts.

Well Tim, as much you think this guy is "James Bond" or "The Jackal", no-one around here has heard of him. We were on the radio last night talking about this guy and no-one else knew of him either. The whole state of RI is about as big as City of New York which means everyone knows just about everyone else around here. I work Europe on the lower side of 47,48,51 and 55 everyday and Ive yet to hear this super villain. Also, anyone with 10 minutes and Microsoft Publisher can have a web-page.

Just because you occasionally hear someone from around here doesn't mean they are the Capo di tutti capi.....this guy is a NOBODY.

Dave, I dont know about where you live, but people were swearing, playing music, meeting up with each other to duke it out, pinning and tearing coaxes off of other peoples houses, and using Fender guitar amplifier reverbs as echo boxes 30 years ago where I live. These instances are nothing new to CB radio and have actually dissapated in my area of New England. Mr. Kasupskis problem is that he just got his Ham license after 25 years of CBing which makes him believe that he has been knighted a radio-cop.............How fast they forget. If CB pissed him off so much, why didnt he get his Amateur license 20 years ago and more importantly, why is he still wasting his time on CB? When I got PO'ed at CB 24 years ago, thats exactly what I did only to find a different kind of nit-wit on the Amateur bands.

His problem is that he thinks his new license has made him "born again".

>THOSE are the ones that are
> ruining CB.

No-one is ruining what is already ruined.................You'd have to go back to 1958 to find CB purity.

Worked just the opposite for me both times I tried the GPK-1 ground plane kit. It reduced skip contacts, but increased my signal level over line-of-sight. I thought I was just imagining things the first time, but the second time I had a another A-99 sitting twenty feet away that I could switch between. Several skip contacts reported lower signal levels on the one with the GPK-1 ground plane kit. I have not used the GPK-1 since.

Well I know it's possible to talk overseas on 11 meters. I've
done it. Lots of times. On SSB it's easy. One day I was talking
to California, when someone mentioned they heard the UK. My antenna
is on the back of the vehicle, so I did a 180 and called for DX.
Got an immediate response from over the pond. I like the challenge
of AM. It's not as easy on AM from the mobile. Just yesterday
I talked to a fella in Louisiana on CH 13 AM. Didn't even have
to try. If a 2 pill is a big radio, you need to get a clue. I don't
use class C splatterboxes and I keep my radio clean. I hate to hear
"10-9!" I've spoken to CA in the past month on AM from the mobile.
Don't say it isn't possible, because I believe it is just like so
many others on this NG.

Perhaps that is true, but he claimed contact with 112 countries.
There are not 112 countries in Europe, nor are there 112 countries
within the range of any CB radio in this country, no matter how much
power it was running or how good the skip conditions are. So, like I
said, impossible.

> Just too much for you to comprehend that a bunch of CBers do this, when you
> didn't know about it, and had to get a ham license to ATTEMPT to do the
> same.... Maybe you should go all the way and get that Tech Plus ticket!

Too much for me to believe because of my own personal experience.
I've been using a CB since the mid 70's. And yes, I've listened in on
the freeband frequencies many times. And even if I were to contact
every single overseas station I have ever heard on those frequencies, I
could not come up with contacts in more than a few countries. It is
absolute nonsense that a person could make contact with 112 countries.

> I will accept 5 people with verifiable radio licenses operating illegally.
>
> Found a way out with wording, didn't ya Dwight.

Not a way out, Toll. Just the facts. As long as he is running
illegally, with fake ID, he can claim just about anything he wants. But
that does not make his claims valid.

In fact, even if he were to have QSL cards, we have absolutely no way
to verify that they are his, or that he got them from actual radio
contacts with others. Anybody can contact people overseas on the
internet and ask them to send a QSL card. Try it. You can get a great
collection of QSL cards in just a few weeks. Then you can claim that
you made contacts with 112 countries also.

You dont even have to get out of you car to read most city electric meters.
They are usually right on the front corner of the house and they can be
viewed from the drivers seat with a cheap pair of binoculars.....

Back when I was just a wee-folk.... I had a CB 'walkie talkie' from
Sears. Two channel, but fairly full featured with squelch and a
sensitive front end. A friend and I in 4th grade each took
'curtain rods' and 'wrapped' them to stick to the chimneys on
our house. We didn't even use coax, just a lentgh of phone
wire (solid wire, a single strand) to get from an aligator clip with
a big screw on it to where we soldered it to the curtain rod.

Now, this was the early 60's, and there wasn't near the traffic
on the bands then, but occasionally we'd hear skip, and a few
times even talked to people. We even carried one of our
antennas up to the mountain top near where we lived and put
it high in a tree to try it.

When it's open, it's open.

About 1978 or so, I lived in Bethlehem PA, and talked car to car
one saturday morning with a stock CB set with just a mag mount
to a friend in Lubbock TX. Everything legal, other than the distance.
This was SSB.

Like I said, when it's open, it's open.

And when Radio Shack came out with the HTX-100, I had one in my
car, and on LOW power, I worked two stations in a 3-way, me in Mass,
one in the former East Germany, and one just outside of Moscow.
The contact ran for over 20 minutes as I was mobile on I-495. Just
after I pulled into work, the band deteriorated, and I had to go high
power (wow, 25W PEP!) to sign off.

When it's open, it's open....

What you need to realize is that the results you got where due to many, many factors. Some of which are terrain, the cars ground plane, other station you where talking to, The power you used, and SWR. This is a great test to see what will work better on that Car or truck. As for being a solid test on which antenna is better this is a poor test. I have done similar tests. but I have realized that my results are MY results. Sometimes certain antennas work better on certain cars. The 102 is a good antenna if you can put up with the length. I personally like to use a 1000 or 5000 mag mount. for under 1000 watts of power. On my friends van the best turned out to be a Muddy waters slapper(big coil keydown style antenna). It beat several other antennas. Guess what was the closest? A $17 Shakespeare 102 whip. The only reason we run the $100 Slapper is the power handling. He is running 2kw and the whip worried us...
Tests like this are fun and informative but please remember that there are so many different factors that are involved when you just switch and antenna. Oh next time use a radio with a Variable RF power control and use an AM carrier calibrated on a watt meter. Some radios will produce different power levels into different loads. This got us several times... The carrier would change and skew the results......

> >mount type.
>
> Roof mount base load

I have found that both the 1000 and the 5000 work better as a Mag mount than a roof mount. I really do not know why but in both cases Reflected power jumped way up when the mag mounts where tossed and the hole was drilled to solid mount them...

>
> >Did you mount all the antennas in the exact location?<
>
> Yes
>
> >What was the swr of each antenna ?<
>
> 1.6 or lower
>

You really need to tune each one to exactly the same point or at least note each antennas reflected power and SWR so you can review that info as well..

>
> >lets here how scientific your test was conducted.<
>
> There was nothing scientific about it. Real World application. 4 different
> rx'ing stations in diff. directions and distances. Checked barefoot (2w
> carrier), 200w carrier, and rx.
>

I am hopping you used a watt meter and adjusted the power to exactly the same. If you did not the results are worthless. Also if you really want to get into this you can hook a AC volt meter to the RXer at the base side and note actual Volts in the IF gain stage so you are not dealing with a cheap S meter and an AGC circuit. Many CB radios S meters are not linear. They might exaggerate the signal at the bottom side but hold it back on the upper.

See ya

The other guys that posted have good advice. If it is the relay then take a piece of scotch tape and rap it around the coil to insulate it. Over time the relay will magnetize and cause it to stick. #12 told me this trick and it has since fixed two amps...

Don't waste your time, Tim. My demand for proof was rhetorical.
First of all, you could send me all the QSL cards in the world, complete
with certified letters swearing to their authenticity, and I still would
not believe they were authentic. I do not believe that what you are
claiming is possible, so any evidence to support that claim would
obviously have to be fake.

Second, even if your claims were true, I'm not going to validate your
illegal activities so you can go out and urge others to break the law.
And I would never attach my name, or callsign, to the authentication of
any illegal activity.

So, feel free to post your claims to this newsgroup all you want. If
people want to believe you, that is their business. I don't.

Get your facts right, Tim. The guy I'm talking about, William Flippo,
lives in Jupiter Florida (not the Houston area).

And according to the FCC, he was not a ham operator. The magazine
specifically says that one FCC official described the individual as a "freebander."

> > The basic conclusion of the article - stay away from the Amateur Radio

I specifically said that the guy was caught operating an unlicensed
radio station on 28.375 MHz, which is in the 10-meter ham band. That
was even quoted by you in your message.

Could someone please explain what HB2346 has to do
with the FCC? From what I can see, this bill deals
with tax structure in free enterprise zones........

Tracy.... AB7RS,

Sorry, but 2 quarter wave antennas at the
usual 1/4 wave spacing do not produce an
omnidirectional signal! This particuliar
configuration produces an elongated figure
8 pattern at right angles to the plane of
the array!

Jack

I'm putting the old Silver Eagle 200 up for auction. It was my first heater and served me well. Now I'm looking for something better. A friend of mine has a Palomar Elite 100 which I really like, but I can't find them. Are there any amps out there that are comparable to the Elite 100? If not, whats a good box to get thats under 200 watts, has an RF pre-amp and draws low, 12 or less, amps? Thanks.

Yes the original subject was "would being close to a tree cause problems?" I was replying to the posts that were made about ground affecting the antenna. And the answer to the "tree" part of the question isn't always NO. I have had antennas that change tuning by the change in seasons "leaves to no leaves condition" It depends on (for the most part) how close the high voltage node of the antenna is to surrounding objects.

On 01 Nov 1999 22:19:07 GMT, zeroeightytwo@aol.come (Unit 082 Tim) wrote:

Your point is proved in your location for you. Doesn't mean that it will hold true for every location.

>So my point was still proved, how many times have you had this problem with
>an Anton? I personally know that a tree would affect it because of its
>location as opposed to the radiation pattern of this antenna,

Are you talking about the tree being in the plane of the radiation pattern? I have seen this with many different antennas.

>Hightower why dont you explain to the group how the earth would affect this
antenna,

Not just this antenna, but any antenna that's ground mounted. An antenna that's ground mounted is affected more by ground conductivity than one that mounted 1/4 wave or higher. Thats why you see AM broadcast antennas mounted in swampy or low lying areas. The ground conductivity is better, and moving the same antenna to a lower ground conductivity would not only effect the efficiency but also the tuning of the antenna.

> but say guy wires at the base of the Anton would not, also explain to me how
>tuning (as John put it) would help an antenna that was reacting to something
>close by,

If the antenna is reacting to something close by, say a tree acting like end loading. Why do you think that tuning wouldn't help?

> Now I could understand if John had said something about matching
>the antenna, inductance, capacitence etc. etc., but he told the guy that
>"some tuning might be required" all he did was point the guy in the wrong
>direction,

Any time you move an antenna to a different location "some tuning might be required" Thats a perfectly valid statement. Why don't you see antenna manufactures pre tuning their antenna and including in the paperwork a notation "This antenna was tuned at our location, no tuning will be necessary when installed at your location"

> It sure is funny how you post so little, but when you do you
>stick your foot in your mouth taking up for a asshole whinebag, who instead

>of helping someone out only confuses people.

I really wasn't taking up for anyone, I was responding to your post that height above ground wouldn't effect the antenna.

Message-ID: <LR9cWGAbm0H4EwhO@invest.fsbusiness.co.uk>
Source record: 8733

I'm helping a friend market some equipment and parts from a 'silent key' friend.

He does not frequent this ng. He resides in area code 310.

Initial enquiries directly to me.

Tri-Ex H-471 (I think) 71', 4 section crank-up tower with fairly new stainless hoist cable and guy wires, 500 lbs, you move. Located 2 miles due north of LAX control tower, $250

Large (70 lb) prop pitch assembly plus two spare electric motors. Unused by hams, $350

Standard (30 lb) prop pitch assembly, modified, $150

Eimac 4CX100000D (yes, that is the correct number of 000's) with socket, mounted in pro made sub chassis and filament transformer (10V @ 295A) plus radiator and plumbing $3000

This tube was used in a piece of test equipment as a series regulator, mostly for it's voltage handling capability and dissipation characteristics! The plate circuit was connected with #22 wire that really looked out of place.

The half linear:

There is a large linear that was under construction. It is just sort of started. Socket mounted, air system complete, nothing much wired.

The valuable parts are as follows:

A 4CX10000D (used)
An Eimac SK-300 socket, in good condition.
An SK-1306 chimney.

A Johnson 200-205 ribbon coil -- 15uH looks fairly new.
There are two new Groth turn count dials on the front panel but, the knobs for these dials which I think I saw laying around a couple of months ago, are no longer in sight and may or may not turn up.

A filament transformer marked 7.5V @ 100A. An older 8" or so cube shaped transformer (UTC, I think) with some diode strings on top that I suspect are for the screen. There is also a string of six 200V 50W zeners with heatsinks mounted to the side of the cabinet.

A choke for the screen supply and two more small transformers that may be for control or grid bias.

The air system has a Plexiglas plenum and an apparently new dual squirrel cage fan. The fan is just hooked up with test leads. There is a commercial manometer with it's tube attached to the plenum but the manometer itself is not mounted to anything.

The cabinet is a grey 24" panel size rack type. There is a panel for the front of the amp and a latch released door for the back. There are no panels in the front below the shelf where the tube socket is mounted. The cabinet is 44" high by 27" wide by 24" deep overall. It has a few scratches and blemishes as it has been rolling on casters around in the garage for years. It probably weighs about 150 lbs. with the above described parts.

There is no part of a plate supply evident...

$995

The operating linear

Dick, the silent key, acquired a commercial AM transmitter and using this as a base, rebuilt his own daily use amplifier in this cabinet. It is currently configured with a pair of 450TH's (plus 2 spares) in grounded grid. He used to drive it with a Heathkit SB-220. It runs about 4Kw SSB. He ran this amp for years, so at least it is reliable.

The nicest part is that it has:

Good coils switched by a very nice homebrew bandswitch.
Vacuum variables (300pf @ 10KV and 1000pf @ 3KV) I am unsure of the voltage ratings as they may be higher.

Real input tuning and an original commercial meter bridge with 7 meters across the top.

The power supply components.

A 240V variac (1 foot in diameter) rated perhaps at 50A.

The transformer is some kind of fairly modern monster. AFAIK it was made for a shaker table amplifier with a pair of 4CX5000's. The U-I laminations (which are most of the thing) on the plate transformer measure overall 18" x 11 x 6. I would estimate that it weighs at least 300 lbs. It is likely at least 10KW CCS rated. It is open frame with some eyes at the corners for the crane to hook up to:-)

The diode bridge is comprised of a zillion low voltage diodes in a fairly cute Plexiglas housing.

There is an 8H, 1A choke made by (for) Collins.

A whole bunch of 1uF 5KV caps (12) wired in parallel plus six 54uF, 2500V continuous DC rated (they are actually laser caps) wired in series paralell (36uF / 7.5KV effective). Note: One modern capacitor would be physically smaller than one of the laser caps and be rated higher than all these put together!

There are some odds and ends like a giant power contactor, main circuit breaker, and of course the rest of the stuff to make the 450TH's sing.

The bad part is that the cabinet is about 7' high, 3' wide, 2.5' deep and the whole thing likely weighs at least 700 lbs.

$995 You move it.

Everything else plus shipping.

Phil / UK

Why would you spray one side with teflon spray?

Unfortunately, there are many ways to perform this "mod", there are no
"standards". I have no idea how your tech wired these switches.

I do know that channel 14 is usually the high channel point of one
stage, and that channel 15 is the bottom of the low end.

Your best bet would be to get ahold of a frequency counter and go
through the channels, and try all the switch combinations, and make a
new chart.

You might want to try adding a better antenna, like a mobile mag mount or topside antenna. You have to make sure that your radio has an external antenna slot though. Without it, you stuck with listening i guess. You could get youself a mobile antenna from you local Radio Shack for about $20 bucks. You have to see what's right for you though. Do you live in an appartment, or house? If an appartment, try attaching a window mount antenna to your child safty guards, or if you luve in a house. try a whip or mag mount on a pizza pie plate in the attic, and run some wire down. Hope I didn't confuse you too much.

I've seen these really cheap looking GE cb handhelds lately all over the place. mostly $20 to $30 bucks. Has anyone tries these GEs? I don't know the model number, but they are big, take 8 AA cells, and only a squelch, Volume, and channel up-down button. A lot of holes in the front with a channel readout. Thanks

Guess it is impossible to do single band DXCC.

Your right. All the ham operators that have tried it and accomplished it on
10 meters for single DXCC are liars, as well.

What a joke.

No, you found a way out.

I can vouch for it. During the last sunspot cycle, I operated almost entirely from the mobile, and the highest power output I could muster was about 500 watts (A Pal 350MDX amplifier).

I contacted every country in Europe, three of the USSR Republiks, South America is very common, had a Sked with two gentlemen in New Zealand (they loved the name Shane for some reason???) and Australia was common.

Like I said, it would be impossible to get DXCC on 10 meters, huh?

>

and if you deal with clubs, it is even worse than that. they bitch about
everything that goes on on the rptrs, thats why i don't support ham clubs
any more, just have my own.

I agree algain MC, even better don't worry about the actual volts just worry
about the actual number which ever reads higher obviously gives a better
signal. To give a better idea you can use the volt meter in conjunction with
the watt meter. Say you start with 5 watts and produce a 20 on the ac
meter, Drop the power in half take a reading lets assume it is a 10 you can
now say that 10 points are 3 db the meter readings may not be linear but you
can figure it out from there with a little common sense

For what band,CB? I built 1 of the TDOA units you see advertised for $18 or so,think it was the "handi finder".These work great for AM signals.If your interrested in higher freqs I built the Doppler with the digital filter featured in QST earlier this year and its the best I have seen.A kit is available from Ramsey.

Attenuater kits are now only $35 from arrow antenna or you could build
an active attenuater for more attenuation.

Phil, I am sure it may have been a form of harmonics, but the point also being is they changed the frequency when propagation changed and the woodpecker was pulse width modulated, dirty signal designed to splatter, You couldnt do this with a am signal. So again My point remains you do not "especially Cbers" create there own conditions. Yes more power will get you further than someone withless power. I don't give a flying horsefarm you don't/can't just key up the radio and talk where ever you want whenever you want. Even if you are a SuperStar on the Bowl.
Mother Nature will not allow it. People get all juiced up when the sunspot cycle comes to a head and we hear the guys 30 over/S9 all day long How about when the Solar flux is at a low Do they key up and make there own conditions then. Phil Always a pleasure. Listen for me on the Bowl

I have a CAM 88 that did excatly the same thing after it exploded a capacitor, would key only for a second then start to chatter or not even try. I was a 200 MFD 16 volt cap and located on the terminal strip that is on the right side of the power transformer when the radio is upsidedown and the face towards you. The closest value radio shack had was 220 uF at 35 volts which is still within the 20% tolerance alowed for most caps. It still works great and its been a couple of years now. If that doesn't fix it than it could some other part in the keying circut.

Bill,
I'm having a problem with it. Thats why I'm in the market for a new one. When its on low the SWR shoots up to 3.5 to 1. On high its fine, 1.2 to 1. I thought it was the antenna system so I went out and bought a Wilson 1000. I still got the same high SWR readings in the low setting. Without the amp in line the SWR is flat. It doesn't put out much power anymore either. 60 watts low and 105 high and no swing with the meter on the peak power reading setting.

> Up until THIS Year they used to allow "anything" in if it was a 10M radio,
> as long as it didn't have 11 in it.

That is not true at all.

Uniden had to run the non-modifiable CPU in the HR-2600 because of the FCC.

Their have been other radios (very short lived) that also had to either be made nearly unmodifiable, or pulled from the shelves.

But I have seen the FCC citation given to
> the Truckstop in Maryland 2 weeks ago.

If the rigs where converted, I would see why.

If they where not converted, then the FCC just stepped over a VERY deep line of free trade and that WOULD be grounds for a law-suit.

Every radio produced that had capabilities from the factory would be a problem. Kenwood, Icom, Yeasu.

Galaxies might have more of a problem (same as the knock-offs) since they have a 40 channel selector and a non-functioning bandswitch, but they are still legal radios in as much as my Kenwood TS-440SAT is just as easy (and their are others that are completely programmable from the faceplate) to modify for illegal frequencies.

>The fcc now considers (they put this in writing) most 10M rigs as "designed >for primary operation as a CB", and as such they are taking the attitude that >they are non-type accepted CB equipent.

That could and will be fought in a court of law if the radios where non-modified. I would accept the challenge there, just on the grounds of singling out one brand (since Jimmy P. is the sole maker (nearly) of the equipment, and they went out after his companies last year and lost), attempting to bring down a legal business, etc.

The FCC does not have gratis rights to bring down a company if they are working within the confines of the laws and regulations put forth.

Nowhere did they change the rules and regulations, so nowhere can the FCC start enforcing things that don't exist..... At least not if people stop them.

> The truckstop was cited for NON-Modifyed 10M Galaxy radios.

I would love to be the lawyer in defense of a mom and pop shop in this one.

Jimmy P will also love this one. Or at least, his lawyers will!

They(FCC) also
> mentioned in the citation specifically that they tested the RCI 29XX
series &
> Galaxy 10M radios in their lab & found them to be "designed for & easily
> convertable to" CB radios.

Which has been a well known fact for a few years.

They seem to be using the premise that the rules
> state "Equipment designed for" Citezen's Band use must be type accepted as
a CB
> Radio & they are now interpreting that to include most current 10M rigs.

I can just as easily modify a Kenwood, though.

That is where you have to draw the line. Just because something is more affordable, and in the hands of the public, as well as more accessible to the general public (because of price, in this case) doesn't mean that any faction of the US government can take them down.

Stay tuned to this one.... I bet it gets interesting. The FCC could stand to lose on this... Being the bully in town will only carry you so far.

In a
> related incedent earlier this year, the FCC would not allow a shipment of
> Mirage RCI-2950's into the country, using this same logic.

Mirage radios come converted. Therefore they are subject to import restrictions.

I think the Mirage
> people here are starting to use the name "VIRAGE" on some radios since
this

Sorry,

But we have been using wireless networking for a long time.

The future may be fiber for campus backbones, or on a switched network, but
it is far from fiber in the house!

Too expensive
Too fragile.

The FCC has already authorized microwave research and development bands.

Their is several ISPs here in Houston that are offering 3 to 10 megabit bi-directional internet connections via this method. Small antenna on your house, fractional T-3 for a hundred bucks.

Only drawback...

You have to be line of site to the main transmitter.

Toll Free

Hold on here. You have the theory all wrong. When you spray the
teflon, (teflon is the words slickest substance) the RF slides off the
element easier. Therefore spray the forward half of the elements
for improved gain, and glue sandpaper strips on the back side
for improved front to back ratio.

The easiest way is to purchase a pair of identical beam antennae. Most beam manufactorers will also carry a stacking kit which will include the stacking bar and the cophasing harness (wiring harness made from coax or whatever) that they recommend for stacking their antennae. I don't know if you've taken a look at the picture of my stacked threes, but they can be seen at http://www.zebra.net/~grndrgn/cbthirteen/news.html

I have built a few 1/8 loop DF antennas. I can believe that
you do have a directional 1/8 loop with half of it teflon sprayed,
however.....it is not because of the spray. Check it out yourself.
Remove the teflon, and check again, or flip flop the teflon
sprayed side. You will see no difference in directionality.

The reason for the directionality in the first place is that the
loop is out of balance. Any 1/8 loop that is hooked to a piece
of coax will not be balanced and will show some directionality.

This out of balance condition is not really desired. It will
not give you the extremely deep nulls that a balanced loop
will. The deep nulls of a balanced loop will give you the
most accurate results.

Chris wrote ...

My first antenna was a K40. Then I played around with a 5' Firestik II, Antron 1700, and a big ass double coil X-terminator. Not one was any better than my original K40. Now I'm thinking about getting a Wilson 1000 magmount and calling it quits. Is the 1000 worth buying? How does it compare to the K40 in regards to transmitting and receiving? Will it handle 26 to 28 mhz and still retain a low SWR? Thanks.

Yes to all the above. I ran a Wilson 1000 when I was active in CB and it was an excellent antenna. Worth the few extra bucks. I recommend getting a lip mount as opposed to the mag mount. Works even better.

Interesting to note that I have never heard an 11 meter AM signal while I was working CW in the Extra portions of the bands. I have been QRMd by a few who strayed too near the 10 meter CW/Data portion. But you are right ... generally, I could care less. My main purpose in monitoring the NG is to lend a hand where I can. Particularly where antennas are concerned. I've said it before ... If we put 3 dollars into our antenna for every 1 dollar we spent on our radios, well ... just try it and see how much better you get out. It's like the difference between a rat shack mag mount and a Wilson 1000. Not much of a contest, huh?

Hi Jack,
> Sorry, but 10c/ps (10 hz.) isn't an amateur band!
Well I kind of know that (G4ZOW) but, was it 'Big' a few posts ago stated that it used to operate anywhere between 3 and 17MHz. I'm sure you remember that even though it seemed strong on one part of the SW spectrum you could still hear it in the background on whatever frequency you were listening.

I'll go download all these sites for reading later.

Tnom, the purpose for the Teflon is to slightly attenuate one side of the antenna which eliminates multiple readings on the coated side of the antenna. Try it, it works. Spray one side of your loop antenna and rotate it. You'll see almost 3 db difference between the two sides.

Geez Wildcat; come on now. You really think you can make an antenna directional by spraying an insulator on an antenna? Teflon was first used an insulator for radar in aircraft. Is that whats confusing you?
Maybe thats why mobile base antenna don't work, after all they have that insulator at the base making the antenna directional right into the body of the car. If you really believe this, hows that line go, Ive got a beautiful piece of swampland in Florida that's just right for you.

I will go along with this. I ain't never seen one for 11m though...I guess if you had a tower big enough you could stack two dipoles one atop the other off to the side of the tower. I think you'd find that the pattern is not omni directional but what's known as "offset". Offset patterns can be very useful, indeed, as there is almost always a direction that you have no interest in transmitting in.

What is this Antron? I thought that it was an end-fed dipole. If it really is, the addition of ground radials should not improve the performance of this stick as the radiation angle should be 0 degrees anyway. Seriously here. I agree that you want the lowest angle of radiation to talk the farthest. I think this is why those Super-Scanner antennas seem to have an edge for DX. Just my finding here.

This sounds like a mega hack job to me. In stock electrical trim the PLL in the radio can "tune" 128 channels - max. Having a six position switch and a three position toggle means you have 18 different bands of 40 channels - which is quite ridiculous.
You can bastardize the radio to expand the coverage further, but given the narrow tuning of the receiver and transmitter there is little point. Your best bet is to sit down with a frequency counter and go through each channel and make note of where you are. If you can find your popular local channel on the radio, which in your case could be quite a challenge, you should be able to locate someone locally who would loan you their frequency counter - or help you with your radio.

Good luck, it sounds like a gem!

This is no flame, just a thought. Perhaps you have set yourself up for this kind of treatment? After all, how did they find your house? If you do business as Joe Snodgrass Radio and you are the only Joe Snodgrass in town, and you have a listed phone and address in the book, you might just expect some of this at one in the morning from the insomniacs. CBers are a strange group. Maybe you are too nice? When the guy comes in and wants to make you an offer on one of your fine radios, look him in the eye, then at the price clearly posted and then explain that THIS IS the price. Cuts down on discussion. As for repair work--when the item is dropped off for repairs, extimate the best time you can get it out in, then add two days, and put it date on the customers receipt ticket. If you get it done sooner, he will be thrilled. If he complains that Bubba down the road said he could get it done in an hour, tell him that Bubba can have the job, but don't bring it back here when Bubba breaks it.

I don't know what the teflon spray does. In fact I ain't never seen teflon in spray can form. I would recommend using a radio that has a good RF gain control that will kill even the strongest signals. Drive north, if the signal goes down, it is south of you. Drive west, if it goes down it is east of you. Turn the RF gain down and narrow your search. You should be able to nail down anyone within about 15 to 20 minutes. You may also want to get a friend to transmit near you so that you can see what meter deflection his strong signal will give you with your RF gain throttled all the way back. That way when you go out transmitter hunting you'll have a better idea of how close you really are. This all takes a little practice, of course. When you find the person you are looking for make sure you are bigger and uglier than he is!

Well poss. playing with the xtal(s) and/or building
a new lil' oscillator board with T/R switching may
alleviate this "problem".

The so-called "lookalike" CB, the TRC485, seems to
have different innards - same skin, different guts -
at least from some parts sheets on the Tandy support
website that don't correspond to what I see in the
HTX10.

Putting on a CW mod shouldn't be too bad though -
I bought it for 10m and have no interest in freeband.
Neverthelesss, I like to know what the circuitry
could do.

Find a copy of the ARRL Amateur Radio Handbook. There should be information in it. There are schematics for making one from scratch, and you should be able to figure from there what you need to do. Most Field Strenght Meters are not expensive, and would be less bulky than a VOM, leads and whatever adaptation you build. The book should be available through the local library. Also, some past issues of 73 magazine, and Pop Com should have articles.

Back it up Wildcat, don't try and brush it off. You are the one that has an understanding problem. Very personal, you have no hay in the field. What kind of intellect would even come up with such a hair brained idea? Spraying an insulator on an antenna makes it directional? Maybe you need to patent your idiotic idea before Cushcraft, or Mosley beat you to it.

Hello everyone;
One of the members of this group has come up with a new and very radical idea how to improve our antennas. He says if we spray one side of the elements of our antennas with an insulator that we can make it directional. He suggested Teflon spray, That may be hard for some of us to come up with. Do you have a supplier for this spray Wildcat? Maybe one of those lacquer sprays would work? Or maybe a wax coating? There not quite as good an insulator as Teflon, would they work? Can't wait to find out how much this will improve my front to back ratio on my beam.

i asked the same question a while back, or for the blacks, i "axed" the
same question.

I am aware of all the points you made. This is not the firs test of this nature
I have performed, nor will it be the last. On Vans, cars, trucks, hoods,
bumpers, trunks, roofs, forward wattage, reflected, etc, etc.
Results don't vary much.
I was simply making a point to the 102 lovers and the newbies. I fugured folks
like you and a few others have already done these tests and then some, but
thank you for your input, I'm sure it will be very helto others who wish to
attemp tests of their own.

You're missing the point, Scott. We're not talking about the occasional lucky overseas contact. He claims to have worked 112 countries, which is absolutely impossible. There are not 112 countries within range of any CB radio in this country, no matter how much power is used.

There are only about 260 countries in the entire world, and he claims to have made contacts with nearly half of them. As I said before, absolute nonsense.

You say you have "talked overseas." Have you heard 112 countries on your CB radio, even on the freeband frequencies?

So, if his claim of working 112 countries is suspect, than everything else he says also has to be suspect (including the QSL cards he claims to have).

And how many of your friends have made contacts in 112 countries?
We're not talking about the occasional lucky overseas contact. He is
claiming to have made contact with 112 countries.

And he claimed to have made those 112 contacts during one sunspot
cycle using nothing more than a 25 watt radio and an Antron 99 (that is
exactly what he claimed in his message - look it up).

And, if your look at my response, I told him there "is no way you have
contacted that many countries with the equipment you describe." And I
stand by that statement. He has not contacted 112 countries using
nothing more than a 25 watt radio and an Antron 99.

For that matter, I do not believe that he has ever contacted 112
countries using any radio in the freeband frequencies. There are only
about 260 countries in the entire world. He is claiming to have talked
to near half of those countries. Again, absolute nonsense.

So, if he lying about contacting 112 countries, you simply cannot
trust anything he says. If that is true, then why should I believe him
about the QSL cards? If he were to send my any card, why should I
believe that he got them the way he claims?

This doesn't make a whole lot of sense. If Galaxy didn't get a cease and desist order, why are FCC agents telling shop owners to remove their radios? Have any shops tried challenging these citations? Most radios are capable of being operated illegally, so I find it hard to believe that the FCC could single out a few models to go after without getting themselves involved in some sort of selective prosecution challenge from the manufacturers. It's pretty easy to get a Kenwood-Yaesu-Icom to operate on CB frequencies, so why couldn't they also be considered non-type-accepted radios. This just sounds like government harassment. I hope the truckstop on MD tells them what they can do with their citation.

Oh, he's much better at it than you, Toll. He claimed to have made those 112 contacts during one sunspot cycle using nothing more than a 25 watt radio and an Antron 99 (that is exactly what he claimed in his message - look it up).

And, if your look at my response, I told him there "is no way you have contacted that many countries with the equipment you describe." And I stand by that statement. He has not contacted 112 countries using nothing more than a 25 watt radio and an Antron 99.

Now, read that again, Toll. He didn't just say he contacted 112 countries. He said he contact 112 countries using nothing more than a 25 watt radio and an Antron 99.

And I didn't say that he had not contacted that many countries. I said that he had not contacted that many countries using the equipment he described.

However, having said that, I will _NOW_ say that he has not contacted that many countries using any radio in the freeband frequencies. There are only about 260 countries in the entire world, Toll. He is claiming to have talked to near half of those countries. Again, I say that is absolute nonsense.

So, if he lying about contacting 112 countries, you simply cannot trust anything he says. If he will lie about one thing, he will lie about anything.

And now here you are claiming that you have contacted every country in Europe. Right, Toll. Sure you did.

Yes, of course, and as each Dayton comes around each May I've never got enough money together to make the trip worthwhile even though I fly your way many times. Probably visited more states than many on this ng:-)
> hey is that one of the reasons we fought
>you guys , so we could have unlimited rf potential,
No, that was to chat up our girls.
> ,......icm
>out..........ps. are you a engineer?
No, it's been many years since I was an engineer, and then I only repaired juke boxes and video games. I soon learned I would never be in charge of Sony Corp' and so I left and moved into marketing.

I currently play around with PMR/LMR equipment and am working on a low power AM broadcast transmitter project to market to our budding broadcasters. We have a low power licence here in the UK.

I have a fairly large web site sitting on server space where I was intending to market a wide range of good radio equipment but that is on hold as I decide if it's worth trying to sell to radio enthusiasts. My better nature tells me it's no longer worth it. It's impossible to compete on price with many imported items as our cost is greater than those in your country due to freight, excise duty and import taxes and then a minimum of 50% mark-up which is only good business practice in my humble opinion.

Go look

> Just my finding here.

Actually, its the Solarcon A-99. It used to be sold by a company
called Antron (the model number was 99 - hince the Antron 99). However,
the company split up several years ago, with one owner keeping the name
"Antron" and another owner keeping the rights to that antenna.

The second owner started a new company, called "Solarcon," and renamed
the antenna the "A-99." However, since many older operators still know
the antenna as the "Antron 99," the name still sticks to this day.

It is described by the company as a "half wave over a quarter wave
variable mutual transductance tuned antenna." It is normally sold in a
"big-stick" style arrangement, but has optional ground plane radials
that can be added for an additional cost (the GPK-1 ground plane kit).

It is very popular in the CB band, especially with freebanders. It
can handle higher power levels and has a very wide bandwidth.

Saying that a material has dielectric capabilities means that the material is a better electrical insulator than a conductor. It does not mean the material will attenuate RF. Plastic has dielectric capabilities but, unless it is really thick, it will not attenuate RF in any way.

Spraying Teflonï¿½ on an antenna should have no affect its RF properties.

Why would you spray Teflonï¿½ on one side of this antenna? Teflonï¿½ has
no ability to affect the RF properties of the antenna. Teflonï¿½ is like
a plastic coating, it may not conduct much electricity, but it has
little effect on RF.

> you don't have to do that, just leave off the spray, and it might work.

Actually, he could just leave the spray on. It should not affect the antenna in any way.

However, we should straighten out his description of how to use a loop antenna for RDF work. When the widest part of the loop is facing the signal, the meter reading will be higher. When the ends (sides, whatever) of the loop are facing the signal, the reading will be lower.

The disadvantage of this type of antenna is that it is easy to confuse where the signal is coming from - the signal could be coming from the front or back of the antenna and the reading would still be the same. You could use your body to attenuate the signal, but I doubt that would be enough to show up on most radio meters.

This explains why there are many different RDF antenna designs. Each has advantages and disadvantages.

This has been tried at least four times that I know of. The first time was less than six months after the rule was added. In each case, the FCC has said no.

And they have a long list of reasons to support that decision - no compelling reason to change rule, not in the public interest, not compatible with the intended purpose of CB, other radio services for that purpose, and many others.

Given the current negative attitude many people have towards CB'ers today, the FCC is not likely to change its mind at this time. In other words, this petition is a waste of time.

such an ass. he'll see. i sent the photo copies of the cards. front and back
with all the valid info all hand written most are flag cards of the countries
but others are post cards. if he say i got them off the net thats strange
because all the ones i sent him were contacts from 94 and 95 when hardly
anybody(especially me) didnt have the net.
PS nobody qsl's over the net. just once in a while a newbie on here will try
and usually gets flamed lol

This is from my post Phil you have to read all of it not just selected sentences.Notice the word primary .The signal was alos varied according to which band was open "propagation wise"

"The Russian signals are primarily pulsed at the very
dangerous 10 Hertz Extreme Low Frequency (ELF). It has remained on the air
more or less continuously ever since. Varying up and down through the
frequencies between 3.26 and 17.54 megahertz, it is pulse-modulated at a
rate of several times a second, so it sounds like a buzz saw or woodpecker."

>"Uniden had to run the non-modifiable CPU in the HR-2600 because of the FCC."

The HR-2600 was very short-lived & Uniden brought back & continued to sell
the 2510 untill it was discontinued a few years ago..

>"Every radio produced that had capabilities from the factory would be a
>problem. Kenwood, Icom, Yeasu"...

I agree. The ARRL should fight this because "next year" this same FCC logic
could target thesde radios too..

>" using the premise that the rules
>> state "Equipment designed for" Citezen's Band use must be type accepted asa
CB Radio & they are now interpreting that to include most current 10M rigs.

>"I can just as easily modify a Kenwood, though".....
> True, but A case can be made though that your Kenwood is not "Primarily
designed" for CB operation, (no 40ch dial, roger beep, mike & power connectors
that match Cobra, not sold thru truckstops & CB shops ect..)

> "Mirage radios come converted. Therefore they are subject to import
>restrictions....."

Mirage RCI-2950's DO NOT come converted, they are 10M only & exactly the
same radio as the RCI-2950's except for the name on the outside of the box (and
the picture of the big "18 wheeler" on the box!!)
> If the FCC really continues this policy, they will most likley "clarify"
their CB regs in regard to this "primarily designd for CB use" stuff to go
along w/their policy IE.. "no radio designed to operate solely between 24 &
30 Mhz shall have 40 "channels or memories, or any multiple thereof...., All
Band & other controls must be fully functional when imported"....ect

Boy, I must conceed the discussion to the RF engineers on this NG. Espectially you Mr. Lowtower, or perhaps your real name should be inserted here. Aparently you guys know much more that both the Diamond and Larson Antenna Companies, which presently use Teflon to minimize RF splatter on several of the ground elements on some of their antennas. I must say I am impressed. All of this wasted talent is being spent on CB.

Perhaps you guys should send your resume's over to them because Im sure they'll want your genius on their staff as soon as possible.

PS: I almost forgot! You guys should also let computer board manufacturers know about your discovery so they'll stop wasting their time spraying all those components as they come off the production line. They'll be very unhappy to know that their attempts to reduce all of that stray RF running around in a CPU cabinet has been in vain.

In the 70's, I could count on the fingers of my hands, the number of
"agitators" there were. And it was different then. An agitator back then
was usually a "mr. Hyde" alter ego of another "normal" operator, that
was just tweeking someone that displayed the verbal equivilent of a
"kick me" sign. Today, the jerks are just jerks, they don't really
"talk" to anyone, they just want to impress everyone with their 4 letter
vocabulary and elementary school education.

> and using Fender guitar amplifier reverbs as echo boxes 30 years ago where I live.

Ah! We had guys that used reel to reel tape delays and reverbs for echo
effects too. The difference is that it took some "engineering" to make
it work. You couldn't just plunk down $40 bucks at your local truck
stop, and buy them. These guys pumped up the echo for pure entertainment
and fun(and just to prove that they could do it), and it only lasted for
a hour or so. It wasn't a constant thing.

Again, from my area's perspective, the A*-hole factor was less 20 years
ago, and could actually be entertaining to listen to on occasion. Now,
there is no creativity, just vulgarity, and there's more of it, or at
least it seems it as the amount of "normal" people diminishes.

> His problem is that he thinks his new license has made him "born again".

It's easy to assume that. But if he didn't have that ham license, what would that make him?

>

A sad but true statement. But I'd settle for the "good clean fun" of the 70's.

Teflon Spray? Pray tell, what will this do?

> Then just follow your S-meter for peaks.

The loop antenna tunes for nulls not peaks. The null is much sharper
than the peak (Which is parallel to the loop).

Another trick is to place a magnet mount antenna on the center rear-most
point of the vehicle. Spin the car in a circle, and peak the signal.
Then drive in that direction.

> When you get close to the area, start reducing your RF

This will usually work fine for close in. Having a handheld radio with a
good "S" meter also helps to narrow down places like row houses, and
apartments, where the antenna may not be visible.

>
> If you really want to get technical, you can build a couple of "Active"

A "Doppler" direction finder is the best solution. It requires 4, 1/4
wave antennas placed in a square pattern. The electronics switch signal
phasing between the 4 antennas, and determine the direction (Usually on
a 360 degree set of LED's). These are available commercially for around
$600, and a place called Dick Smith electronics used to sell a $99 kit.

BZZZTT! Wrong answer. The "flat" side of the loop is the "null". You point the pointer for the lowest signal, as the null is much sharper than the peak is.

>
> The disadvantage of this type of antenna is that it is easy to confuse

> You could use your body to attenuate the signal, but I doubt that would
> be enough to show up on most radio meters.

A loop is bi-directional. You have to use a loop in conjuction with another method to resolve which side of the loop is the "correct" one.

We sometimes used a mag-mount mobile antenna, mounted on the rearmost center part of the car. Spin the car around and peak the signal. Then drive in that direction, and use the loop to fine tune your heading. This type of Df'ing is best done with another person to operate the switchboxes, and draw the lines on the map.

We used to track signals with our base station's first by triangulating with 3 different station's beam headings. Then we would go in the direction of our beams, in the mobile, that way we knew that the loop null signal in front of us was the right one. It never took us more that a 1/2 hour to find any base station jammer. A smart mobile jammer was much more difficult.

Please don't.. The VFO Slides Transmit and Receive Stock. The Lincoln does not have a clarifier. You are probably talking about the R.I.T control. This is Receive incremental tuning. This is used to touch people up on SSB. This is only for RX. You need to set this in the center. Then tune people in with the VFO on the last Span setting. Then if need be touch them up with the RIT...

> capabilities but, unless it is really thick, it will not attenuate RF in
> any way.

TEFLON (Polytertrafluroethylene) has Aluminum atoms as a substruct (PSSSSST....dont tell Mr. Lowtower). It is the Aluminum that gives TEFLON its heat dissipation capabilities. Aluminum, along with Soy polymers account for about 80% of TEFLON'S mass. TEFLON is identical to Polyethylene however, the only difference between them is that instead of hydrogen atoms (in Polyethylene) there are fluorine atoms (the result of which is TEFLON). Most computer board manufacturers coat their products with TEFLON in an attempt to insulate any electrical discharge and stray RF that may take place while contained in a CPU cabinet. In addition TEFLON makes for excellent Baluns. Every wiring harness and bus panel in the Space Shuttle is generously coated with TEFLON as well.

When exposed to the elements over a long period of time, TEFLON will oxidize and "pit" similar to a solid Aluminum wheel on an automobile.

Source record: 8901

That's correct.

If you have the resolution on the VFO, then leave it.

If you tie the transmit to the receive on the clarifier, then when talking to another station you can 'walk' each other up or down the band.

The BEST solution is the transmitter being tuned by the VFO. If that isn't fine enough, then a second control with as a 'fine tune'. With a SEPARATE receive only control.

The reason the clarifier is so commonly 'unlocked' on CBs, is that the channel control generally give you 10Kz resolution. If you had better resolution on the main tuning, then you wouldn't need the clarifier to change things as well.

Hmm, I wonder why no one thought to put 'dual controls' on some CBs? I don't think it would actually be that good an idea, but hey, it would be the mod people would want, and pay for, right?

Oh boy, another clarifier thread. I recommend that a qualified technician modify your rit to work on transmit. It's very easy and has always been beneficial to me. The stock vfo will only tune in 100 Hz increments. These guys who tell you not to do it don't know about ssb evidently. I work primarily on ssb and 100 Hz just does not cut it. Plus it makes it hard talking in a round table if somebody can't tune to the others.

I recommend changing only the 8v source and not changing any components or any of the circuit. Of course you will have cut one diode to remove the tx only voltage source. Touch up the pll so it will be on frequency with the rit knob centered. On my HR 2600 I can turn the rit off. That should satisfy the purists. For ssb operation, I have not found a better mobile radio than this line. The only way to do better is with an amateur radio. JMHO. Have fun.

> operation.

In some areas, local police are already taking action in this area. They are using the premise that the "illegal" operator is depriving the neighboring homeowner (the complaintant) of the peaceful enjoyment of his/her home. Many states already have laws on the books supporting this premise, so it is fairly easy to charge the "illegal" operators under one of these statutes.

This also applies to the "illegal" operator depriving the radio operator of another radio service (the complaintant) of what is legally his/hers (the radio frequency). Again statutes exist in most states that support this premise.

Note that both of these are not based on the actual radio itself, but on the results of the use of that radio (hince avoid FCC entanglements). Let me give an example that might explain this idea better.

If a drunken pilot, operating his aircraft in a dangerious manner, were to crash his aircraft into a town, the local police would not have to go through the FAA to charge the pilot with violating a whole range of local statutes. In other words, they are not going to charge the pilot with violating FAA rules - they are going to charge him with operating a vehicle in an unsafe manner, reckless endangerment, etc.

Why should this idea not also apply to the "illegal" radio operator? They are not charging the operator with violating FCC rules. They are charging the operator with violating local statutes which apply to all who live in that community.

The measure currently before Congress would make the process a lot easier (less stretching to make local statutes fit the problem), but is not absolutely necessary to police local "illegal" operators.

What does not exist in most police departments is the expertise to hunt these "illegal" operators down. However, some states are waking up to the idea of using outside individuals, such as Amateur radio operators with RDF skills. Others are turning to outside agencies with

RDF capabilities, such as the Coast Guard, Coast Guard Auxiliary, Civil Air Patrol, certain military radio facilities, and others.

Message-ID: <7vq0dkkbl1@oak.prod.itd.earthlink.net>
Source record: 8913

Actually... I just noticed you said 'opened' and not 'unlocked'

If you in fact mean 'opened up' to extend how far it will drag,
commonly refered to making it a slider, I would advise against
it, especially for mobile use. You can do it, but some rigs
become so touchy as to be useless. All that involves is (on
most rigs) taking out the elements that 'limit' how far the voltage
from the pot can swing. This is usually a resistor or two and
a diode.

If you insist, then consider replacing the pot with a multi-turn
unit.

Make the decision on what YOU want to do though, not on
what other experts tell you must be done. Especially when they
say it's the only way to go. Most things you do to mod the
radio are tradeoffs, some not so obvious. Even a fixed
transmit with receive clarifier has advantages, just not too
obvious.

Too many people want a 'slider' just because of hearing other
people talk about it, when in reality it's a PITA. The original
range of the clarifier is usually enough MORE than 99% of the
time. And if not, well, you could always have someone fabricate
a 'pull up/pull down' on the voltage feed with a switch to act as
an extension of the clarifier range.

Too many people don't know what the hell they are doing though
with a clarifier and end up with what they think is great, but sounds
like trash on the air. Hey, some people think that's good! But
it also means other people don't understand you as easily, and
limits the number of people who want to talk to you!

Keep it clean. Keep it stable. Keep it loud. And the whole world
will respond.

Mike

Larsen, read them your statement about RF splatter. The Lady at Larsen chuckled about and answered no we don't use teflon for that reason. The Guy at Diamond/Rfparts laughed out loud about it. They both stated that they did use teflon in connectors as an insulators. Maybe we should send our resumes over to them, at least we know that they don't use teflon to eliminate RF splatter. Care to pull another lie out of your butt?

What does this have to do with your magic directional antenna? Stick to the subject. You have given a nice explanation of uses for teflon, none of which pertain to making a directional antenna. Most computer manufacturers do not coat there boards with teflon. If they are coated, they are coated with an acrylic polymer or conformal coating.

I ran a test on your theory Wildcat. I used a HPE4422B and a HP8594E. I didn't have any Teflon spray, so I used a length of Teflon insulation. The tests were run at 1.8 Ghz. The Teflon did not make the test antenna directional. If you think the frequency I used or not actually having teflon spray influenced the results I will rerun them for you.

You were absolutely Correct, Jackson! Many thanks. You just saved me alot
of money having to ship this thing out of state. I live out in the
boondocks, and there just aren't any CB shops in North Dakota.
You Da Man!

Regards,

Cary Fries

>antenna for RDF work. When the widest part of the loop is facing the
>signal, the meter reading will be higher. When the ends (sides,
>whatever) of the loop are facing the signal, the reading will be lower.

If i'm interpreting your term, "widest part facing the signal" as
meaning the plane of the loop being perpendicular to the
signal direction, then your explanation is backwards.

When a both halves of a balanced loop are equidistant to
the signal source then no voltage difference will be induced
in the loop. This would be a null.

When one half of the loop, is closer to the signal than the other
half of the loop, then a voltage will be induced.

If you viewed a loop from above, and the loop was represented
by a vertical line, then the pattern would be the number eight.

I 8
loop pattern

That is a decent price on the Madison, assuming it is new, in box, and unopened.

The Palomar amp will do 300 with a normal radio driving it, and about 400 with a "driver" amp run into it.

The 500 watt figure is more of an input power figure, used to fool people into thinking they are getting a 500 watt linear for a good price.

The best way to figure a linear is to take the retail price of it, and multiply it by 1.

Nobody is giving things away, and a 500 watt amplifier will usually run right about 500 bucks, retail.

A 300 dollar amp will usually peak at about 300, or in that ballpark.

Folks...

The HTX-10 and TRC-485 share a common outside, case
shell, etc. but I believe HTX10 poss. uses a different
internal board.

I looked at some of the documents, parts lists, etc.
on Tandy/RS support site and the 485 key parts list
seems to be quite a bit different than what I'm seeing
in my HTX10 (different parts designators, etc.).

Not sure how different the HTX10 is from the Ranger 10m
rig that's being sold by Bill's 2-Way, though.

Of poss. interest: in my HTX10 there are 3 jumpers in
the rear of the radio - 2 closed ones next to each other
in the driver/final area and one open on near what
appears to be the AM modulator/audio area...

The PLL and microcontroller are combined in the HTX10
into one chip on the control board. The PLL programmable
divider setting is via software controlled register(s)
instead of external serial link or parallel control
lines. Moving freqs around would poss require xtals to
be changed, etc. or writing new firmware - since these
are ROM'd chips you'd need to order a min. run of 5000
chips or so...

Oh well, have to wait till the service manual arrives..

-Bill

It will attenuate the signal going into the area where the teflon is, thus making the signal on the other side higher. Sort of like having a brick wall behind you can only go one way.

The short answer is yes.

The long answer is that it'll take a little more engineering to do it
than a simple swap. Tell the group exactly what you have and maybe we
can come up with a plan of attack.

For CB radio, Messenger made the cleanest units.

If you can find an older one.

The new Texas Stars are also VERY clean after modification... Inasmuch as they don't produce as much (but damn near it) power as they used to (pre CW transmitter days), but they do have the cleanliness area licked!

My old Antron stood on a 70' tower thru Hurricane Opal which was amazingly still a cat 3 hurricane when it's eye passed over Montgomery, AL (normally hurricanes have already deterioriated into nothing but a mass of thunderstorms by the time they reach that far inland) I stepped outside and was looking at the antenna in between rain bands and watched it get laid over parallel to the ground, then when the wind gust died back a bit it'd stand right back up straight. Only reason it's not still up there is I upgraded to stacked 3 element beams.

I use wire. A general purpose G5RV (inverted vee) up about 50 feet and then several cut for exact frequency. Since I work mostly CW and under 100 watts, wire does me just fine. (not that I would refuse an 80 meter yagi if someone dropped one in my yard) I talked with a guy the other day who said he uses a random loop placed up against a window using suction cups, then fed to mini-8, thru the tuner to his TS50. A great fixed station setup if your'e travelling and stopping overnite in a motel or hotel.

> Care to pull another lie out of your butt?

Sure Frank, whatever you say. Try an elementary physics course at your local Community College then we'll finish this discussion. You see, unlike you, I only comment on things I personally know about. You'll never see me commenting on amps or radio building because there are others on this NG who are far more proficient than I. Inversely, you will always see me commenting on physical science/power distribution (which wire and antennas fall under), mathematics, and legal subjects. This is because I can defend my position with facts, as compared to the BS like you spew forth.....Have fun!

PS: Hint: put your brain to work an check out the Summer 99 AES Catalog for your Teflon education.

From: Green Dragon <nunya@business.com>
Message-ID: <382105d3.0@monster.zebra.net>
Source record: 8959

That would be a challenge. I could probably handle the programming end of the task given sufficient time to learn a programming language that allows that much detailed control over an I/O port. Right now the majority of my programming is limited to Visual Basic. I do already have the skeleton of the program written with the beam heading calc fully functional and debugged. Was a good bit simpler than I expected, only had to write a few functions to handle some of the trig. functions that VB can't handle with it's own built in functions. Arcos, Arcsine, Convert Degrees to Radians, and Convert Radians to Degrees. Then write a couple more functions that are fairly high level calculus to combine each of those function calls properly to solve for the heading in degrees. Multi-variable calculus is quite difficult for someone who's been out of school for going on 12 years now but with the help of a couple of well worded queries at Ask Jeeves I was able to find the info I needed.

The truly hard part for me would be the design of the hardware needed to interface with a Ham IV rotator. I'm not much good at designing circuits and such.

Hmmm.... I imagine it would go something like this:
1. Calculate the beam heading desired.
2. Read the voltage of the current of the appropriate lead in the rotator cable as set by the potentiometer in the rotator that would normally drive the degree indicator on the rotator control box, and interpret that voltage to determine the current beam heading..
3. Based upon the current beam heading, decide which direction it would need to go to reach the new heading without trying to turn the rotator past the stop point.
4. Apply voltage to the appropriate pin on the I/O port which would trip the appropriate relay, sending positive voltage up the appropriate lead in the rotator wire to the rotator
5. Monitor the change in the voltage indicating the current beam heading to update a graphical degree indicator on the computer screen and to ensure that the rotator isn't going the wrong direction (error control).
6. Once the rotator has reached the desired degrees remove voltage from the pin in the serial port which tripped the relay which fed power into the rotator to make it turn.

addendum: Before any action initiating a turn of the rotator another pin would have to be fed voltage to trip another relay which would feed power to the solenoid to disengage the wedge brake if the rotator being controlled has such. Likewise, when movement has stopped engage the wedge brake by dropping the voltage from the involved serial port

pin.

Hmm... Now that I think about it a little bit, and see the basic steps that would be involved it might not be quite as hard as I orriginally thought. Perhaps I'll investigate this idea a little further and in some future version of my program implement such if no one beats me to it.

Gordy & gang...

>> Hyundai is the "vendor" of the TRS (HTX10) CPU. The
>> software was written for 28.0~29.699MHz. The radios
>> are made by Seung Yong, Inchon Korea.

I don't know who actually makes the HTX10 - but that CPU/PLL info is not quite right... but then perhaps other radios in similar skins may well have different innards (i.e., TRC485 CB vs. HTX10 ham rig. Same outward appearance but seems to be different internal boards) and may be made by different vendors. Can't always judge a book by the cover...

Whenever I see an import chip w/an "LC..." prefix, I think Sanyo. The key IC in the HTX-10 is the LC72322N, and is a standard Sanyo semiconductor catalog item. (By "standard", I mean design available to all customers, and non-custom except for the mask ROM'd firmware; because of the customer-specific mask ROM, these aren't off-the-shelf parts. You'd need to order 5000 or even 10K of these parts to justify them firing up the line to get a new mask run done. And there are no EPROM-equivalent parts, it'd seem.)

This IC has 3 key items: a 150MHz PLL, a mask-ROM CPU w/RAM, timers and I/O lines, and an an LCD driver.

See

http://www.semic.sanyo.co.jp/english/catalog/INFO.html

and drill down thru their idiotic website - get into the datasheet area where you can enter "LC72322N" (without quote marks) as the part number. It's a 13 page spec sheet in .PDF format of which only 9 pages are accessible due to their screwy website - the .PDF's come a page at a time.

The firmware indeed restricts things to the 28.0-29.7 MHz range. There are no obvious jumpers or lines to cut on the control+PLL board so as to "go play around". The LC72322 PLL programmable divider register is only "viewable" within the firmware's memory/I/O mapping and is not brought out to any external wiring that can be rejiggered.

In fact, if there *were* a line or jumper to cut that would cause a shift in freq. to out-of-band areas or CB ch. 1 to 40, that would've been an *INTENTIONAL* hidden feature - this

kinda stuff doesn't happen by accident. CPU/PLL combos like
this are chosen so as to *avoid* "tampering".

Only possibility of playing with new xtal osc freqs offers
any chance of "alternate configuration" - and I won't know
that till I see the schematic & service manual. And even if
one were to "move" the radio, the freq. display would be wrong,
etc.

-Bill

Not sure what the absolute maximum is, OM, but I live in the
northeastern USA where the winters are cold and windy, and my A-99,
mounted on a 10-foot mast in a three-foot tripod on the rooftop here,
withstood several days worth of 60 miles per hour winds last winter
(which I believe works out to about 96.5 kilometers per hour)...and
higher gusts. If I did the conversion correctly, the mast would be a
little over three meters, the tripod, not quite 91.5 centimeters.

We had a couple of days in a row where the above wind velocities were
pretty much sustained over a 48-hour period, with gusts nearing 75 MPH
(or about 120.7 KPH).

Mine does not have the radial kit.

Hope this helps.

Among the various radios I use is a Cherokee AH-27F handheld. I have used it with the antenna supplied by the manufacturer, which is a rubber-duck type base-loaded job that measures about 9-3/4" long from the tip to the BNC connector at its base. I have had pretty good results with it (considering it's a handheld), but nevertheless I have been wondering if anyone in the NG has tried any other portable antennas on one of these radios, and if so, how they compared to the one supplied by the manufacturer.

I know that Wireless Marketing offers two other antennas for the AH27F (and its SSB cousin the AH-100)...anybody tried either of those, or perhaps something from another manufacturer?

Please reply here in the NG if you would...private e-mail doesn't reach me unless you're on my mailing list. Sorry, but too many flamers and spammers out there on the net these days.

73 and good DX'ing,

I agree with John. I am located in NE PA and had an antron 99 with 2 ground plane kits withstand similiar wind speeds for many years. My antenna was mounted on a 40 foot tower. It even survive the tornado we had last year with wind gust around 100 mph.

Read my original response to your message, Tim. The one where you
claimed to have contacted 112 countries. The quote above is exactly
what I said in that response. So I'm not back peddling, I'm just
repeating what said to a person who obviously has no reading comprehension.

> > However, having said that, I will _NOW_ say that he has not contacted

> term was DXCC enteties and not countries

Who is back peddling? In the first message, you said 112 countries
and now you say something else. You're like a little kid. You got
caught telling a lie, and now you're trying to cover it up with more
lies. You haven't contacted 112 DXCC entities either.

This is getting silly. Make your claims, Tim. I'm not going to keep
arguing with you. You keep changing your claims to fit the
circumstances. And I've got better things to do.

Okay, Landshark. You've posted my message again. Now show me where I
said that "local cops will have authority over FAA officials."

I said that local officials can charge a drunken pilot with operating
a vehicle in an unsafe manner, reckless endangerment, etc. And I said
that they would not have to go through FAA officials to charge the pilot
with violating those statutes.

But nowhere in that message did I say that local officials have
AUTHORITY over FAA officials.

Are you sure, Dave? Heck, I haven't done this in so many years, I
probably could be wrong on that. Actually, I have not played around
with RDF equipment since about 1977 when I was hunting down a "person"
who was continiously playing music on the local CB channel.

Lately, I just drive around, watching the radio's meter, to find
people on the CB band. I've got to get back into RDF though (on the VHF
marine channels), so I guess I better study up. I'm going to build the
antenna, but I seriously doubt it will be a loop.

Big Sexy <outsiders@powerbomb.com> wrote in message news:gs3T3.1209$no.13060@news3.voicenet.com...
If we ignore these morons posts they will go away, They are no Code Techs wanting to prove thier worth to the ham communityThe FCC has more to worry about such as child porn, frauduelent web site, cellular problems, cable companies, Ham bands Why would they worry about 11 meters when there licensed hams have screwed up there own bands with profanity, excess power, jamming, pirate radio stations, this is all from a group of people who hold FCC license and are supposed to know the rules. The CB band also has its share of hams that come to 11 meters and play there games. Your saying this doesnt happen. I beg to differ i have seen firsthand many hams running excess power, profanity, and there dropping down to the cb band. I have also been licensed for 21 years in the amatuer service. Just as on the radio if you ignore the carrier throwers etc they will get tired of the one way conversations , if we continue to talk and reply to them it feeds thier fire. Let them ramble on without a reply they will go away

>Typical response from an anti-CB hambo who, like many, is angry and bitter because the radio waves don't belong exclusively to him and others like him.<

Considering some of Dwight's other posts on Ham-related NG's, I hardly think he is some "angry and bitter Hambo".

He is relating simple facts. The FCC is not about to lift what little last vestige of "regulations" it has on 11 meters. It was meant to be a short-range, low-power personal and business communications service, not a license-free ham radio alternative.

And he was being conservative in the "4" number of persons petitioning the FCC to make hobby-type changes to Part 95. In the 34 years that I have been affiliated with the CB service in one degree or another, I would dare sare there have been several DOZEN petitions, some dating back to as late as 1969 that I recall, calling for liberalization of CB rules to make it more "ham-like".

The last significant petition I recall would have made an SSB-only service in the "freeband".

There is nothing bitter about it. It's simply fact that the FCC is not about to relent on 30+ years of virulent "no-hobby service" on 11 meters.

>I know that Wireless Marketing offers two other antennas for the AH27F (and its SSB cousin the AH-100)...anybody tried either of those, or perhaps something from another manufacturer?<

Although not "portable" in the sense that you can walk around with it, one favorite portable antenna of mine is the "coaxial dipole".

Take a piece of coax (preferably RG8X, but RG58 will work too) that is about 200 inches long. Split the jacket so as to expose 108" of the shield and inner conductor.

At the end of the cable where the jacket is still intact, seperate the braid enough so as to be able to pull the inner conductor thru it and thereby make two "legs" of the dipole. Put an appropriate connector on the jacketed end. Probably best (but make your own choice) to put a PL-259 on it, then use adaptors to mate other connectors.

Then you can put a loop on either end of the "legs" and tie them up to opposite supports, or hang it from a tree so as to be vertical.

If anyone wants a diagram of how to do this, send an SASE to my ham callsign address and I will be glad to return one to you free of charge.

Yep. I still have a loop, although I don't use it much these days (most
of the idiots are mobile). The pointer is usually perpendicular to the
loop, and it corresponds to the sharp null in signal.

> Lately, I just drive around, watching the radio's meter, to find

On VHF bands, the doppler unit is commercially available, and will do a
much better job than a simple bi-directional loop.

All this makes for facinating reading, but it still doesn't explain how
it's supposed to "attenuate" signals on one side of an antenna.

If I place a non-conductor in direct contact with an active antenna
element, it does not react to the signal. If I place a conductive
substance in direct contact with an active element, the conductive
substance just becomes additional radiation area. It might affect your
impedence match, but it certainly will not add directional properties.
Otherwise, if it were that simple, there would be commercial "teflon
beams" available. Last time I checked, I didn't see any.

I just love CB "science".

I think we all understand what the teflon is "supposed" to do, but what is lacking is the explaination on just HOW this is accomplished. A substance is either a conductor, or an insulator. Placing either in direct contact with an antenna, will not appreciably affect it's radiation characteristics. Parasidic elements (Conductors) need to be placed at precise wavelengths away to be effective as reflectors or directors.

Just like running co-phased antennas. If you place the antennas a 1/2 wavelength apart, they produce a pattern that is directional. As the antennas become closer together the directional characteristics diminish until they occupy the same space, and the pattern would be the same as a single antenna.

What the hell is "RF splatter", as applied to antennas? I've never heard
of such a thing, or any mention of teflon being used by Larson or
Diamond (and I own examples of both).

> around in a CPU cabinet has been in vain.

Spraying a computer (or any other) PC board with a conductive coating
will short the components out, and render the board useless. Most
conformal coatings are designed to seal out moisture, and are usually
acrylic based.

There is a conductive spray that they spray of the insides of plastic
covers, to help shield against excessive RF radiation (It's usually
cheaper to spray a plastic cover than to use a metal one). But this
conductive spray is not composed of teflon. This I know well, as my
company uses this method for all of its international products (which
have to meet tougher radiation standards than the FCC)

Teflon's main uses are related to its non-stick properties, and as an
insulator. Teflon is used as an insulator (I have coax connectors that
have teflon as the insulator), so how can a substance that is an
insulator also be a conductor? If it is an insulator, it cannot function
as a shield, as any shielding must be conductive.

You keep spouting all this double talk, and then make ad hominem
comments toward anyone asking for you to substantiate your claims.

>

The BIGGEST reason that the FCC will never lift the 150 mile limit is
that the HF bands all fall under ITU regulations. The ITU is an
international organization. One of the ITU rules stipulate that all
operators on bands that have the capability to propagate
internationally, and support radio services that include international
contacts, be able to send and receive morse code. the reason that the CB
band is exempt from this requirement is because it is designated as a
low power, non international service.

This code requirement may be reversed in a future WARC or other
rulemaking, but for now it stands.

No it won't, its an insulator, it will not anttenuate the signal. Even if it were a conductor, its in contact with the antenna and would not anttenuate the signal. Try it, take a reading on your antenna, place a strip of electrical tape down one side over the Entire length. Did the antenna become directional? NO, now tape a length of tin foil down one side of the antenna. Did it make it directional? NO again.
Spraying your antenna will not make it directional

What does increasing an antennas mass have to do with making it directional?
I'm not sure what physical science you are using to come up with that answer.
Maybe you would like to explain to the group how if they increase the mass of
their antennas that they will become more directional. Why don't you take a
few minutes and call Larsen and ask them yourself. You made claims about their
antennas that you cannot substantiate, it pretty foolish on your part to post
something that can be proven incorrect by a simple phone call.

I have a 200 watt am to 300 ssb solid state A.C. linear for sale.
Its a two final amp with hi/lo, am/ssb, and rec amp switches on it.
Pre amp does not work, 50 cent part to replace. has new finals. Asking
$150.00

I used this amp for a driver for many years and never had a problem with it
till recently I blew the finals and replaced them. I modified it to except
the flange mount transistors. It used to use stud mount type.

You can buy a fan with a thermal couple already built in it, or buy a thermal control switch that can be mounted on the heat sink that will close a set of contacts and allow power to pass to any fan of your choice to turn it on. What needs to be considered is what temp would you like your fan to come on at? Then drill a hole or machine out a hole in the heat sink for the thermal couple to seat in, use thermal grease between the two parts so that it will allow the heat to transfer between the two. On the flange of the thermal switch do the same thing, use the thermal grease between the heat sink and switch before mounting it to the aluminum.

Comair Rotron makes a fan with a thermal couple already built in and I think Galco Industrial Electronics sells thermal switches. I believe thermal switch is are a cheaper way to go. I hope this helps.

in the short answer, PROBABLY NOT.
most any walkie talkies made in the last 10 years have what's called "the
impossible pll chips".
they won't let you change crystals or jump pins to get more channels.
the old ham international w / t's had a pll02a chip which was easy.
most of the newer ones have either a tc-9106 or a c-5181 which can't be modded.
about all you can do is either experiment with small pull caps like 5 to 33 pF
across the 10.240 crystal or get a 10.245 crystal out of an old scanner to jump
the channels up by 5 kc. 26.970, 26.980, etc.
if you try to pull it any more than that, your channel frequencys will not be
consistant across the band.
in other words, all of the channels won't end on .005 or .000.
good luck.
jeff

If you want something to spray and be conductive to shield, go
to a good TV parts house and ask for the spray for TV tubes.
I believe it's called Aquadag, Aquadak, or something like that.

But if you mean to try to solve an RF problem in a mic.... I don't
think it will help.

I tried the spray, as well as a lot of other techniques, years ago
to quiet down TRS-80 computers. I got my old Model III almost
silent on VHF and above. But not by spray. I ended up 'screening'
the main cage area, and wrapping the disk drive tower with
grounded foil. I also wrapped the keyboard cable and grounded
it, and put a grounded shield over the whole bottom of the case.
(I did make sure the air slots were open!) I could never get it
quiet on HF though. On the other hand, my old Model II was
surprisingly quiet on HF, but tore up VHF like crazy.

Spraying the case never worked a bit on either of those computers.

At least they are getting a little smarter about it (corporate-wise) -- they now have "suggestive-sales" prompts on the point-of-sale computers that list items to suggest to the customer as each item is scanned or entered. If you buy a piece of equipment, usually it prompts for extended warranty, for example, as well as batteries if the item uses them. They're getting better at that. Granted, it lowers the IQ required to be a Radio Shack salesperson, so that anyone with a third-grade education can probably qualify. (OK, so say it -- that was the requirement before!)

> Diamond (and I own examples of both).

RF Splatter is stray RF that falls outside the intended transmission lobe of an antenna. I would suggest you refer to a Radio Engineers Sourcebook (Watkins: Haydon Books, 1974) for a precise definition.

> Spraying a computer (or any other) PC board with a conductive coating
> will short the components out, and render the board useless. Most
> conformal coatings are designed to seal out moisture, and are usually
> acrylic based.

Sorry Dave wrong answer. Conductivity and Insulativity are based on density (molecule compaction) and frequency at a specific temperature. What may be an insulator at one frequency may be a conductor at another. This is Physics 101. The plain fact of the matter is that I personally know a computer component manufacturer that coats their components prior to packaging becuase the TEFLON serves multiple purposes. Now you may argue this fact with me, however it still doesnt change that they are in fact performing this process. If you really want to get technical about this please email me and Ill be happy to send you either a web site or literature demonstrating this materials quantum structure.

> You keep spouting all this double talk, and then make ad hominem
> comments toward anyone asking for you to substantiate your claims.

Double talk eh?.....What double talk? Im not submtting this method for a patent (and Im not the one who originally dreamed up this brain-child) Ive stated my position quite eloquently and I dont have to justify my original post to any of these engineer wanna-be's. If the people who read my posts cannot comprehend them, I havent any control over that. What you find on this NG are people who base their biases on personalities and not facts which is similar to CB radio. One can grow ten feet tall behind a microphone if one so chooses.

The bottom line is your comments, like others posted here are based on a best guess with absolutely no factual or scientific data that would prove my posting is incorrect. I would suggest that if you are going to talk like a scientist, at least go out and act like one, and actually PROVE what I stated as being wrong. My original claim remains the same. Spraying a generous Teflon coating to 1/2 of a directional loop will result in an approx 3 db difference in the received signal (all things considered equal). If you and Mr. Hightower have some factual data, other than person opinion, to prove otherwise, please post it.....Theres nothing ad hom about it.

Yes it does however the reason I posted it was to give some individuals an understanding that this material is not just "duct tape" as some contrarians in this thread believe that it is.

> If I place a non-conductor in direct contact with an active antenna
> element, it does not react to the signal.

Thats absolutely correct.

>If I place a conductive
> substance in direct contact with an active element, the conductive
> substance just becomes additional radiation area. It might affect your
> impedence match,

Right again but you forgot about bandwidth.
.
> Otherwise, if it were that simple, there would be commercial "teflon
> beams" available

No there wouldnt, and the reason for this is because you are attempting to compare the reactance of a 1/8 wavelength homemade antenna that has perhaps a 10mil coating ("at best", which is easily damaged) and impracticle to maintain, with full scale CB/Amateur/Commercial antenna manufacturing. We both know there are much simpler ways to manufacture antennas to achieve 3db attenuation, both mechanically and electrically (and at the same time, have the antenna last a long time). What we are talking about here is slight attenuation for the purposes of discounting a particular direction when using a loop constructed in this fashion, WHICH DOES WORK.............

>I just love CB "science".

So do I, especially when ego's are left out of the equation.

Do they spray the compenents to eliminate RF splatter as you put it. Teflon has many uses, eliminating RF splatter is not one of them. Again you are not sticking to the original issue. Spraying your antenna will not make it directional. Are you ever going to stick to the subject and answer it?

Ok, Wildcat which is it? You made a post that stated that Diamond and Larsen go to the added expense of spraying their elements with teflon to eliminate RF splatter. (which is BS) but they won't go to the added expense to "improve" their F/B ratio? If its so impratical to use with full size CB/Amateur?Commercial antennas, (as you put it) what was post about about stating that they did use it for RF splatter suppression. Are you losing track of what you have posted?

Here you agree with Dave, that there is no interaction. But still try and tell everyone it works. Which one is it?

I have heard of a new enforcement effort for the Gov't frequencies
below channel 1.

If you are caught transmitting there, you will be fined, radio
confiscated and you will need $75,000 to bail you out of jail.
There will be no giving up the radio to escape this fine.

I believe this source. He runs a radio shop and had a visit from
Uncle Charlie last week.

Steve, You have pushed the X-force products on people far more so than the dave line, We have had people call you just to find out where you are coming from in regards to this, just look at your web page and see who you are and have been promoting. You have stated you are no longer selling them I think the desicion has been mutual, they have there own web page so its sort of counter productive and it seems you may have been playing one against the other. Anyhow best of luck to you, no hard feelings I am sure, but the few amps you have sold from them will not be missed.Also all you had to do was remove there products from your site, do you tell everyone on the NG everything you do?

> front to back ratio on my beam.

He's not as wrong as you think, although its apparent that Wildcat didn't clearly explain his theory. In reality when an additional base metal (the aluminum present in the Teflon) is added to a portion of an antenna, the antennas resonant properties change proportionate to the added material. What is happening in this scenario is that Wildcat is attempting to make one side of the antenna resonate differently than the other side, hence an attempt to create different reactance levels within the same body. Although the total antenna mass is one, there will be a difference in resonance between the halves of the antenna (electrically, if measured at the antenna), which will result in one imbalanced electric signal being generated to the receiver. This imbalance may very well produce different reception signal levels in different directions however they will be very small.

Source record: 9056

So why would I want to spray one side with teflon, why not just cut the tip of the antenna at an angle? It would accomplish the same thing. And it would not make it directional. You could easily test your theory. Take a 1/4 antenna made of 1 inch stock, attach the center conductor to the very center of the 1 inch stock. Take measuremnets, move the center conduntor to an outside edge. Take your measurements again. Care to bet if you made your antenna directional by moving the center conductor of your coax? The answer is NO, even though you have essentially added a 1/2 inch of mass to one side of the antenna. A lot more mass than Wildcat has added in his theory. Adding mass to an antenna does not make it directional, it would make it more broadbanded. If it were so simple to make an antenna directional, every antenna company in the world would be doing it, and this wouldn't be the first time we had heard of it.

You hunt the null not only because it is sharper but also the attenuation is needed when you get close.Use a sense antenna to make it unidirectional,don't forget to spray the sense antenna with teflon. :)

either you've gone to all those places and interviewed all these people that he "lied" about or you are psychic.
this proves what i've been saying all along about the rf police type hams.
you think you have a corner on the dx market and if you haven't done it, no one can.
in the words of a late 60's steppenwolf song called tighten up your wig:
your mind is so narrow that it's no suprise, if you fell on a pin, you'd be blind in both eyes.
i think someone needs to tighten up your wig.

While cleaning out the garage, I found a big boy that needed to be tested before I sold it. Dragged out a spare battery, got some 2 gauge wire, and put a 1/4 wave whip on so I wouldn't burn up my Firestik.

Anyway, I put on channel 6 and gave a call for Toll Free. Somebody answered me! Was that you?

P.S. Don't anybody ask about the amp...it's already gone-sold!

$$$!!! <:

Yes, I did say...

does the old term "cb handle" mean anything to you?
why arn't hams required to use their names and addresses every 10 minutes
instead of call signs?
after all, it would be easier for field engineers to locate a ham should the
need arise. if i got my license today, it wouldn't appear in the call book
until next year.
if i were to cause a rule infraction that needed his attention soon, he would
have to contact the fcc which would take more time.
if everyone were to use their names and addresses every 10 minutes, he would
have the information he needed right away and there would be no chance of a
mistake with a missed, garbled or mis-understood letter or number in a call
sign.
sound like too much trouble?
same here. your point is moot.
strange.

A 3db change in signal strength is not usually considered large
enough to term the antenna "directional". I will try to substantiate
that with a quote from a well known source.

A 3db difference for a DF antenna is practically worthless,
especially from a non null radiation pattern.

same here. your point is moot. strange.
jeff>>

The existence of a daily updated FCC internet database
pretty much allows any existing, newly licensed or
newly upgraded ham be to positively ID'd within minutes
by anyone, FCC field engineers included.

In my experience on HF, hams by and large seem to LOVE using
their call letters. In fact, I hear many hams overcompensate by
ID'ing every two minutes or so. Not to say they are somehow
"better than CBers" because of this odd habit. It's just a thing I've
noticed. I've found that hams have no problem with telling you
their names and true locations (and sometimes their phone numbers).
After all, it's all a matter of public record anyway.

Yes, of course there are the troublemakers that hang around a
couple of infamous nets. You'd be right in saying that they
certainly don't ID and prefer to stay anonymous. But they are
a tiny minority, so tiny in fact that you could operate your
whole ham career and never cross paths with any of these
guys.

CB handles? I have no problem with that. And my point was that
I notice that a lot of CBers would rather DIE than give away their
true identity while on the air.

I guess it's just a whole different mindset.

it would seem that icom, kenwood and yaseu should watch out. they'll be next.
good bye legal mars and cap operations.
if i were to own a truck stop and had such a citation issued, i would surely
take it to court. these were not "illegal cb radios".
if my uncle, (general class), were still alive and wanted a galaxy 10 meter
radio for his birthday, could i not buy him one?
if it is true, as many have said, that ham radios do not need a cb type
acceptance, why can't the galaxy's be sold in their 10 meter form?

this proves what i've said a month ago. the fcc, as a "rule" making body, has entirely too much leway in changing the rules in the middle of the game.
we all know what people do with these radios but what if galaxy were to go to court and say that they were trying to cater to the legal mars / cap market with the design of their radios?
to be fair, the courts would have to either allow the galaxy's etc. to sell or it would have to force the kenwoods, icom's etc to modify their radios to keep them within their advertised bands.
what's good for the goose is good for the gander.
jeff

i read the power mods for my 2510 several years ago with interest.
when i bought my uniden PRO-810e and the expo 100 for it and installed it, i noticed the driver and final sections of both radios looked strangely identical. and, unless i miss my guess, the PRO-640e mobile and the uniden built rad shack model TRC-473 ssb radios are also the same as there are few differences between their boards and circuitry.
does this mean that the fcc will be cracking down on them next?
it worries me when a government entity can change the rules in the middle of the game without the usual oversight afforded by the constatution of the United States.
just something to think about.

706. Wife, dog and a driver

Newsgroup: rec.radio.cb
Date: 1999-11-04 00:00:00 UTC
From: Greg Miller <greg@millerweb.com>
Message-ID: <2qpU3.323$bh7.25439@nntp1>
Source record: 9091

The usual 40 mile commute on Rt.80 tonight, wife has the mike and she is working a convoy talking to the "boys". One driver announces that he's got his black lab in the cab. He's only .7 ahead so she askes is she can see this dog. My wife is a MAJOR animal lover, especially labs. So we're in the hammer lane and see him up ahead, as we pull up along side (I'm obviously watching his bumper and the road) the lab is on the drivers lap hanging out the window with those ears flapping in the wind. I could only hold formation for 15 seconds and pulled away. I then got a complete description about this dog for a few miles. We yakked with the driver for another 5 miles until we pulled off.

I would extoll about CB on the web and the really great nature we've found 85% of the drivers display, but I would rather not have it be the popular hobby it was back in the 70's. CB is really back in the drivers domain, with a few 4 wheelers involved.

Greg

If you can find out any thing, to mod a htx-10 Please let me know.
I bought one and would like to mod it myself.
Bills 2 Way told me to remove D2 on the front panel and short out
CON401.
But on the HTX-10 there is no D2 or CON 401. There are four blank
solder pads between the bottom row of push buttons, maybe this is where
the D2 is.

The HTX-10 and the SS-4900+, and the Magnum 257 all look the same, but
maybe their not.

If you find out anything let me know, and I'll do the same for you.

Also Bill told me
1. Remove Power.
2. On the front panel remove D2.
3. Then short out CON401 after D2 is removed.
4. Now apply power.

Operation type HAM/ Extended CB is selected by pressing the "FUNC"
button then Pressing and holding the "2(CALL) button for 3 seconds.

Use the same sequence to switch back to HAM mode.
Switch between FREQ and Channel modes by pressing the "FUNC" button then
pressing, but not holding, the "2(CALL)" button.

Switch bands by pressing the "2(CALL) button only

Tom

In a way you are correct, but your theory is physically wrong. Any matter can be made to resonate differently, in different parts even though the subject matter is one piece. A simple example would be the welding together of two dissimilar metals. When combined these two materials will resonate at a common frequency however each of the two dissimilar materials are still resonating at the harmonic of eachs mass. In essence, both of these resonant materials are fighting each other in an attempt to cancel one of them out. The result is an imbalanced frequency which when measured will respond to different frequencies even thought the mass remains as one. Wildcats theory, however ill stated, is theoretically correct. I personally feel the results will be very small however if enough teflon is used which would imbalance the harmonic, a noticeable difference can very well be achieved. The only proof positive is to try it and see.

****
Begin Quoted material

Teflon is an extremely stable plastic material. It is a polymer made
up of completely fluorinated carbon, and long chains of atoms
covalently bonded together with a chemical representation of
C2F4. Teflon if characterized by its high chemical and thermical
stability, and its resistance to adhesion. It is also used as coating
in many different applications.

Teflon is a soft, waxy, opaque material that is nearly white in color.
It is about 90% crystalline and has a molecular weight between 500,000
and 2,000,000. Teflon is polymerized from a monomer (a small molecule
that combines with other monomers to yield a polymer called
tetraflouroethylene), which is produced through a series of chemical
reactions.

Teflon is inert to all solvents and chemicals agents except molten
alkali metals and hot fluorine gas. It is capable of stand continuous
exposure to temperatures ranging from near zero, to where
it begins to depolymerize above 600 oC (1112 oF). Because of its
resistance of the strong C-F bonds to chemical attack, Teflon is an
inert, tough, and nonflammable material widely used for electrical
insulation.

Some of the uses of Teflon include: In the chemical industry, Teflon
is used for tubing, stopcocks, value packing and lining, and gaskets.
It is also formed into rollers, bearings, conveyor belt coatings, and
chemical resistant work surfaces. In the electrical industry, Teflon
is used for insulation, coaxial cable parts, sockets, plugs, and
bases. Teflon coating can also be used on all kinds of cooking
utensils to prevent food from sticking. In addition, Teflon coating

reduces friction and protects against corrosion. Teflon is also often
used as a gasket material on automobile air conditioning compressors.

****
Aluminium ore, most commonly bauxite, is plentiful and occurs mainly
in tropical and sub-tropical areas Africa, West Indies, South
America and Australia. There are also some deposits in Europe.

Bauxite is refined into aluminium oxide trihydrate (alumina) and then
electrolytically reduced into metallic aluminium.

Pure aluminium is a soft lightweight metal. Mixed with small, often
minute, quantities of other materials iron, silicon, zinc, copper,
magnesium, tin, titanium, lithium, chromium, tungsten, manganese,
nickel, zirconium and boron - it is possible to produce an array of
alloys with specific properties for very different purposes.

End of Quoted material
****
There is no aluminium or metal what so ever in Teflon.

There are metalized polyesters and metalized poly-
carbonates. These are not Teflon however.

Teflons chief advantage in RF applications is it's low
dielectric constant (2). A dielectric constant in simple terms
is a measurement of a insulators invisibility or it's ability to not
absorb or interact with RF.

Teflon also has a high voltage breakdown. and withstands
heat very well.

Insulators with high dielectric constants are termed
lossy. These lossy insulators are not used for loading
coil forms because they absorb some RF energy.
Examples of these would be rubber and neophrene.
The best dielectric constant is a vacuum (1). Air is
next with a value of (1.0006).

a
>ham in Hawaii at 10pm from NJ... don't get propigation like that on CB at
>10pm...
>

That is the whole point, there... ajcogswell (or whatever the hell your name is). HAMs have the capability of accessing repeaters (so do we but I won't tell) and propagating a created signal, moon-bounce signals, and whatever.

The whole idea of CB that I hold true and dear to my heart (well not that much) is the amount of experimentation and true enhancement of radio. Clear, concise, solid signal transmission without the heartache of trying to attain a license to get there. Most HAMs lost that inquisitry (not all) after these HI-Tech Kenwood, Icom, Yaesu, Alinco rigs started coming out. Now, (excuse me guys from rec.radio.amatuer.homebrew group) if you turn around and look, most HAMs are leaving the Amatuer Radio world and coming back to CB because CBer's are still doing what Amatuer radio started out doing... making your shit work.

Homebuilding of some equipment (ok... amplifiers) is just one of the ideas that CBers are trying to enhance. Unless you're a QRP type guy, power is a requirement to "get out" on 11 meters. Think why 11 meters were not used at first buy radio amatuers... because at that time HAMs thought that it was an inefficient bandwidth for proper signal propagation (ARRL Handbook). Thats why there are so many amplifiers on 11 meter AM.

What hasnt gone there way? You sold 3 amps total big deal I don't think anyone is crying over that, just your stupid post stating so on the NG . I don't remember you saying anywhere on the NG you werent carrying the cookie amps any longer why is that? The point of the matter is you wanted to take a potshot.Just removing them off your page would have done the trick. But you forget if it wasnt for Davemade there would be no X-Force.
If you feel thats childish youll get over it.

This news group has become nothing more than a place for people, generally hams and cber's arguing about the FCC laws and how they are not followed by cber's. It used to be an interesting group, but it has turned into a flame parlor. What ever happened to the keydown amp debates, and everything else associated with the competition end of the CB hobby? oh well I guess all the RF police have made all the cber's get off the computer and go splatter instead of the keyboard they have ran them off to use the keyup instead.....

"improve"
> their F/B ratio? If its so impratical to use with full size

Ha, Ha.......Hey Lowtower, tell me about Larsens base antenna product
line.....Cant you read?

> >> If I place a non-conductor in direct contact with an active antenna
> >> element, it does not react to the signal.
>
> >Thats absolutely correct.
>
> Here you agree with Dave, that there is no interaction. But still try and
tell
> everyone it works. Which one is it?

Well Frank if you could comprehend my original post, (which is painfully
obvious that you didnt), you would clearly see why I am agreeing with Dave
in this statement. I'm not going to keep repeating myself for you (although
this is very entertaining for me). I would suggest you go back an read it
again. I'm still waiting for your test results at 27mhz. When is this test
going to take place? 1 year from now you'll still be babbling about
this.....go figure it out Mr. Wizard.

For some nonsensical reason you somehow think that you have me up against
your mental ropes which believe me, you do not. If you think I take your
nonsense seriously, you should go out and upgrade that non existent Ham
license of yours. Keep at it, someday you'll make
General.....in another 43 years...

731. Re: Petition Filed With FCC

Because as a general rule, the atmosphere on CB is far friendlier and more enjoyable to most people than any o fhe Ham bands. I've listened in on 10 meters and from what I've heard it's fully of stuck-up obnoxious people who consider themselves to be God's gift to radio.

> improvement.

You won't get any argument with me on that (improvement). Like I said
earlier, any effect is slight. In my case, there was a slight decrease
in skip performance and a slight increase in line-of-sight performance.
And we're talking about slight - not enough to move a needle, but you
could hear a slight difference.

Actually, because of that, none of this really matters. In the end,
in my opinion the GPK-1 ground plane kit simply does not offer enough of
a performance increase to justify its cost.

Considering that it would also be a huge pain to install the antenna
with radials in a tree (the original question), I would recommend just
using the basic antenna and forgetting the ground plane kit (sorry I
brought it up).

Basicly, pressing and quickly releasing the function button will enable the blue colored function of any button to operate. Pressing any button without first pressing the function button will allow the grey colored function to operate.
Pressing and holding the function button for several seconds will turn on the backlight for the display.

If your radio has been converted to enable all channel options, you can change the ten frequency bands by clicking the call button after you have taken the unit out of its default frequency of 29.300. This is done by pressing and quickly releasing to function button, and then pressing the call button and holding it for several seconds. The radio is advertised as having 454 channels...this is not correct, as the unit has 10 bands of 45 channels, for a total of 450. If you are cutting out on AM, it is because you are clipping the mic gain circuit, you can change this by adjusting the mic gain using the procedures outlined previously. It is not really a gain adjustment, but an EQ adjustment that will take some of the bass frequencies out of your voice.

Oh, by the way, you can not convert the radio for channels by pressing any combination of buttons in any sequence for any length of time. So long.

Sorry if the ham radio signature confused you, Green. I suppose it could be turned off when posting to this neswgroup, but that would be a hassle. I post to a lot of newsgroups where that signature is not offensive, and I also obviously post to ham radio newsgroups. To turn it off and on as I enter and leave the various newsgroups who be a real waste of time.

When I post to this newsgroup, I'm posting as a fellow CB radio user. Obviously I use a CB radio, and the issues and politics of CB also affect me, or I would not be wasting my time in this newsgroup.

As for the petition, my post was not some attempt to belittle CB radio. It was a simple statement of facts - the FCC is not going to change its rules. Petitions have been tried many times in the past (four that I know of), and each attempt has failed.

The FCC has given its reasons many times in the past, and I repeated those in my message (they are not my opinions - that is what the FCC said).

I simply cannot see any reason the current petition would change their minds.

I recently bought myself a CB radio because I hear it's all the rage
with you kids. I bought myself a RatShack TRC-236, to be precise.
If you pay no attention to the fact that it's from Radio Shack... Or
the fact that it's a walkie-talkie, it's an alright radio.
But I'm a little peeved at it's "output" power (which, I assume, is
transmitting power) of 2.5 watts. Now this may or may not be a stupid
question, but... [puts on flame-retardant pajamas] could I attach a
linear amp to this? Or, failing that, just modify it? Anything can be
modified, so I'd rather be flamed than told it can't be done.

Darn it, I just don't happen to have any Teflon spray around. Can I use "Pam" cooking spray instead? It has non-stick properties. Besides, Pam is so slippery, that signal would just slide right off the backside of the antenna.

And it would help keep the birds off too. If one landed on the antenna, he would never be able to keep a grip. As he touched down, he would simply spin around the element a few times and let go. One or two times doing that and he would never land on my antenna system again.

I like it. I need to talk to the makers of Pam.

The maker does not list such specifications, so I can only go off
experience. About ten years ago, a Solacon A-99 made it through the
north side of Hurrican Hugo mounted on a forty foot pole less than a
mile from the beach (six guy wires on mast). A tree went down about
seventy-five feet away, but the antenna didn't. However, it did get
sandblasted a little.

In other words, its a fairly solid antenna.

Hey,
I have a question. What makes this radio or a even a Cobra 2000 so
desirable that someone would be willing to pay this much money for? Huh?

You can buy a Galaxy 2517 for just a little more and get 3 times the
radio.
I mean, so what if it's a Madison. You take away the clock and you got a

Washington. Take away the big box and power supply and you got a
148GTL. Big deal! I bought a Yaesu 757 GXII for $450.
Get a real radio if you're going to spend a ton of money.
When they say "what's the twenty on the big radio?", you can't answer
can you?

Oh, by the way, you trolls take notice. Here is a ham with a 1X3 call
sign
winking about the mod for extra channels on the ch 9 button.
Are you gonna bust his chops? I suspect not. I just put this out there
as
a topic for discussion. I will not be participating because I am
boycotting
the trolls. Have a good evening.

Harry

What's Sex?

There's this little Ozark family, Maw, Paw, Junior, and Sally.
One day Junior asks, "Paw, whut's sex?"
Paw sits back, thinks about it, and replies, "Well, Junior, I reckon yore 'bout ol'nuff to find out.
Maw, take off all yer clothes, jump up on the bed, and spread'n'em legs."
After Maw is undressed and lying on the bed, Paw looks at Junior and says, "You see that there hole on Maw?
Well, jist watch ol' Paw."
Paw jumps on top of Maw and starts doing her every which way.
About this time, Sally walks in, walks over to Junior and whispers, "Jun...Junior, wh-whut's that?"
Junior, being a man of the world now, looks back at Sally and grins, "That's whatcha call 'sex'.
You see that there hole on Paw? Jist watch ol' Junior..."

>Hmmm.... I imagine it would go something like this:

I think you have a good idea of what to do for your particular rotor.
Maybe someone makes a rotor that has some type of electronic feedback
which you could query for the proper info. Building your own feedback
box which monitors voltage levels etc. would be tough, but if your up
to the challenge it might be a fun project.

I think you should be able to find some com port support in VB. Your
program will just query your feedback box for the current state of the
rotor. Or, your program could just send the new coordinates to the
feedback box and the box will decide what needs to be done to get the
rotor in that position. You would probably want the feedback box to
at least supply the current rotor state so your program could poll the
box when its first run and display a little picture of a beam antenna
which will be oriented on the screen according to how it is currently
oriented on the tower.

>>CB
>>Radio & they are now interpreting that to include most current 10M rigs.

The mcu,s have the data masked on to the inboard rom at the factory
and it is not changeable.
The more lines of code the higher price for the mcu.
Which is the base price plus a specified amount per byte of data.
A large program may require a mcu with more rom thereby increasing the
base price of the production run.
That is why most manufacturers have the same mcu with different data
on it when it is going to be used in different equipment.
The only time it is economical to have a multiprogram mcu is when

there is only a small production run of many types of items.
That is when you can't afford a 2000 unit run of each type.
This is not applicable to ranger and galaxy radios.

Any thing a cpu or mcu can do is programed in to it.
You can not clip a wire that will allow the rig to do every thing
with out some sort of programing backing it up.
Every button press has a sub routine connected to with it.
Getting firm ware to work properly is hard to do with out other
stuff to worry about.

A channellized radio like a cb usually has a look up table.
Two values one for receive and one for transmit:
It continuously samples what channel it is on.
Then it samples the tx/rx line if it is low it will go
to the RX look up table and send that value to the
synthesizer.
If it is high it will go to the TX look up table
and send the appropriate value to the synthesizer

a multifrequency (IE) ham, aircraft, government, scanners and such,
Usually has a frequency register and increments it up or down when
you change to another frequency.
On receive
It takes that frequency and subtracts the IF and other stuff.
It takes that value and sends it to the synthesizer for receive.
On transmit
It takes the frequency and subtracts the LO frequency and stuff
and takes that value and sends it to the synthesizer.

They are two drastically different operating modes.
They are completely incompatible.

If you are able to cut a wire and get 300 channels.
That means that the look up table has them already.
All the mcu does is check to see if the jumper is there.
If it is then it will use the normal subroutines that agree
with what the front panel has on it.
If it is not then it uses another set of sub,s for the buttons.
The subroutine do not magically appear they are already
present but just ignored till the wire was cut.
The sub,s will allow the use of the rest of the look up table

On ham rigs you do not have a look up table for each of the
available frequencies which is a million+ possible frequencies.
That would be wasteful of memory and make the mcu sluggish.
You have the pre stated frequency register.

That means it can basically go to any frequency that the
synthesizer can handle.

All the mcu has is a table of frequency limits that make up
the ham bands

If the frequency register is within one of the limits then
the line that enables TX is puled high or low depending
on the setup.
If you cut the wire then the TX capability is always enabled

On the radios that allow you to enable wide band TX
from the front panel.
The code is present which is designed to allow you
to disable the TX limits on the radio.

On the rci 2950 the mcu is has two operating modes on is
the normal frequency display with internal frequency register.
the other mode is the hidden 40 channel mode with look up table.
If the mcu was design to be used for cb and ham radio there
would be two programs in the on board rom.
It would go to one or the other depending on if a input was grounded
or not.
The thing is you would not be able to jump between one and the other
with a press of a button.
Having two programs on the mcu requires more rom and a more
expensive chip than making two different chips with different data on them.

That one button activates a long subroutine that does many things
If you are going from frequency display to channel display.

1 save current frequency to other memory that is out of the way.
2 save current settings like frequency split and presets to other memory.
3 save current frequency step and other stuff to other memory.
4 clear all spaces left by the previous data movements.
5 load look up tables to operating memory.
6 load new channel setting from other memory in which it was stored last time.
7 set data bits that indicate what subroutines to use when you get a key press event.
8 and last is to jump to the cb mode loop which will setup every other thing
like setting the synthesizer and stuff

Not easy to say the least because you have to make sure the to different mods
will not corrupt each other. (ie) Both sides of the firm ware using the same memory
location at the same time.

Heck trying to get a 8051 mcu to control fan speed from the reading of a temp sensor
and take the occasional interrupt to load a demand value from a data bus without
wiping out or disrupting the working data is tricky
not to mention doing the 8 steps above.

>>In a
>>related incedent earlier this year, the FCC would not allow a shipment of
>>Mirage RCI-2950's into the country, using this same logic. I think the
>>Mirage
>>people here are starting to use the name "VIRAGE" on some radios since this

>>lists.......
>> Things are going to be changing.....

>>
>it would seem that icom, kenwood and yaseu should watch out. they'll be next.
>good bye legal mars and cap operations.

Kenwood and the others should use the inboard data buss to enable TX
it would prevent tampering.
If they already do then that means the wire was put there just for the purpose
of puling the input low if it was connected.
if it is not then the radio ignores the frequency table.

All someone would need to do if they wanted to operate mars and cap
is send a copy of there license to the manufacturer which would put in a mcu
that allows wide band TX when it is being assembled.

>if i were to own a truck stop and had such a citation issued, i would surely
>take it to court. these were not "illegal cb radios".

The data in the firm ware shows that it has ben designed to operate on the
cb band.
Putting that much designed in to the firm ware means there is intent to have it used
as a cb.
A radio that is intended to be used on the cb band must be type accepted.

If the mcu was designed to be used in a cb and a 10 meter rig
there would be no change over sub routine.
The presence of one indicates it was designed to be used.
Its only use is to jump from cb mode to wide band mode.
That implies it is being used as a cb.
If it is used as a cb then it is required to be type accepted.
A type accepted cb can't be able to transmit on non cb frequencies.
The other half of the change over program is specifically designed to
allow you to TX on none cb frequencies.

If the chip was designed to be used in a wide band receiver (ie) 25 to 30mhz
why dose it have the TX part of program when it is in the wide band mode.
The stuff that deals with offset and other stuff only slows the mcu down
and makes it sluggish.
If it was to be designed for extended receive when it was being used as a ham
radio why dos it not have a subroutine to block TX when out of the ham band.

>if my uncle, (general class), were still alive and wanted a galaxy 10 meter
>radio for his birthday, could i not buy him one?
>if it is true, as many have said, that ham radios do not need a cb type
>acceptance, why can't the galaxy's be sold in their 10 meter form?
>this proves what i've said a month ago. the fcc, as a "rule" making body, has
>entirely too much leway in changing the rules in the middle of the game.
>we all know what people do with these radios but what if galaxy were to go to
>court and say that they were trying to cater to the legal mars / cap market
>with the design of their radios?
>to be fair, the courts would have to either allow the galaxy's etc. to sell or
>it would have to force the kenwoods, icom's etc to modify their radios to keep
>them within their advertised bands.

HDV refers to High Drive which means that the amp can accept the 10 watts AM/25 watts SSB that the import radios are capable of producing. Probably involves some sort of built-in voltage dividing attenuating circuit to reduce the drive input to the transistors.

I have a freind who has become interested in getting into CB radios. I am pretty new in the circuit myself and asked several people about all the different radios before I bought one. I ended up buying a Connex 3300 and it is doing everything that I wanted it to. While I was looking for a radio I had someone give me a little 40 ch Midland, I don't even know what model it was. I gave my friend that radio and he had it modified and is getting about 14 watts off it now. He is now looking at getting another radio that is capeable of my watts bearfoot. Since I have only used the Connex I wasn't sure if there was another radio that might a good start for him that wont cost as much as some of the exports. Any info would be helpful. Thanks

Source record: 9158

I've done a little research. The software end of it could be done easiest by writing a DLL in C++ then calling the functions in the DLL from within VB. Basically, let C++ do the work, and design the GUI in VB. VB doesn't have functions for the level of com port access that would be required built in. One idea I had today would be to see if any of the rotor manufactorers would be interested in developing the hardware side. If I had some idea of what such a control box would be able to provide in the way of data thru the serial port it'd be a major help in getting the program going.

At any rate, such a program would be quite some time in development. I'm basically listing it as a future enhancement of the program I'm working on now. It's going pretty well. I find myself learning a lot as I try to get into database programming for the first time.

Later on....

If you stayed within the context of "for a DF antenna" it is
practically worthless. You can get better results by using
your own mobile antenna. Hold it horizontal. Point it toward
the source. You would hardly call that antenna a DF antenna.

DF antennas that show large differences in values of gain, typically
60db or more.

Well, since the boards inside are all similar in make up, and a little birdie at ranger explained this to me, they are produces by the same factory. Nobody knows who connex is. It is just economically priced so the shops can get it out reasonable.

Ranger claims they make all the 10 meter rigs and then they are stamped with the name that someone wants to pay for ie, Northstar.

One of our most popular radio's. Connex 3300.

Boman 930 AM mobile, in nearly new condition, this is a NICE full featured radio with built in SWR meter, dimmer, RF gain, stock mike, this rig had little use since new and looks it! Has the very easily modified 02a chip, but has never been modified or assaulted with a Golden Screwdriver. The RX is strong and the NB & ANL functions work great, the TX audio is strong and clean with a stock mike.

If you are looking for a nice radio built the way they used to be, or want to build a Hot Rod mobile, don't let the name fool you, this is the real thing!!!

$60 shipped to your door. ppd. MO only
email replies please.

would
> be doing it, and this wouldn't be the first time we had heard of it.

Sure they would. Every major base antenna company would voluntarily love to
increase their manufacturing and packaging expense only to sell the antenna
for the same amount of money. Its apparent that Economics wasnt your major
in college either. You are trying to compare a home-made 3 ft tall antenna
to what Antenna Specialists can manufacture and market on a large
scale?.....Man, you just dont get it do
you.....

More on the question.

You can use an inexpensive mobile on a power supply. Use a 6 amp power supply. Not a 3 amp. Sometimes 3 amps just isn't enough. Especially for the tinker'er.

Pro510xl or used radio will do and a good antenna. Omni directional is usually the choice of most. The real serious dx'ing person will go with beams. To much to start out with.

Cobra makes a small base station. 93
Cherokee makes a small am station CBS500
And then there is sideband.

Stock radio and antenna just getting started you can get an Antron 99 great antenna and pro510xl refurb and power supply for less than $150.

Most base stations are going to start new at $129 and up.
Plus the antenna. The antenna is going to cost if you have it shipped. Don't let the $39.95 price tag or $49.95 price tag fool you on an antron 99. The people that ship will charge you around oh guessing $12.00 shipping and handling. Maybe $15.00. Its best to go to your local dealer and purchase the antenna and coax. The antenna does not come with coax so be prepared to tell them how many feet you need. Mini 8x will do.

I hope this answer's some questions for the newbies out there. Unless you are sure you want to go powerhouse start with the basic cb. You can always upgrade if you like it.

And what sort of "friendly" DX do you work? Do you engage in QSO's or do you just exchange the "numbers" and move on to the next guy?

CB or ham radio, there's no difference in the style of "wham-bam" DXing. So what do you care if the guy on the other end is "stuck -up" if all you're interested in is the QSL card?

And speaking of stuck up hams, do you consider hams from all over the world to be stuck up, or is this strictly an american thing?

I find international hams (real DX) to be very warm and friendly. A friend of mine recently was in Germany, and managed to hook up with a guy he met on the radio some years back, through DXing, had a good German meal, a tour of the area, got to work DX from the German Guy's station, and had a very good time.

I think this "stuck up hams" stereotype has gotten inflated far beyond reality.

Reality is that hams are very friendly to people who act responsibly. When they "take an attitude" with someone, it's when the other person displays a lack of maturity, courtesy, or average intelligence. I've never had a problem communicating with other hams. I just know not to talk about subjects that would generate a negative bias (You don't say how great the Braves are at Yankee stadium). Once you get to know a person well enough to have debates, then you can let your opinions flow. But you can't expect to get on the ham bands, and act like a CBer, and expect a warm reception and instant respect.

Tell me kindly, just what material conducts at one frequency or
temperature, and then insulates at another? Some conductors "conduct"
better at some frequencies, than others, and some insulators "insulate"
better at some frequencies than others, but I've never seen one that
crosses over the fence, so to speak.

I am also quite familiar with manufacturing processes, as I've had some
experience with it from my various jobs throughout the years. I've never
seen a teflon based product applied for conformal coating. The question
still remains, which is it? Conductor or insulator?

>

But you do. You see, if a scientist or anyone makes a claim, especially
a far-out one, the burden of proof resides with the claimer. In other
words YOU have to prove the validity of your claims. WE do not have to
disprove them.

I can claim that there are little green men on the moon too, does that
automatically make it true, and up to you to disprove? I think not.

> If the people who read my posts
> cannot comprehend them, I havent any control over that. What you find on
> this NG are people who base their biases on personalities and not facts
> which is similar to CB radio. One can grow ten feet tall behind a microphone
> if one so chooses.

This has nothing to do with personalities. This has everything to do
with RF currents, and antenna characteristics, as well as the properties
of conductors vs. insulators.

You've presented a process, which uses a material that starts out as an
"RF insulator", but then morphs into a "conductor", and now it's a
conductor at one frequency and an insulator at another. If this isn't an
example of a tap dance, I don't know what is.

So... Now that we've once and for all established the electrical
properties of teflon, (which I think most of us already knew), how can

teflon insulation cause an antenna to become more directional,
especially since it has a low dielectric constant?

This may be true. Ham operators have had to suffer before, due to FCC actions to thwart illegal Cbers. Case in point: HF amplifiers.

> what's good for the goose is good for the gander.
>

Well, there are a few different ways of looking at it. It's plainly obvious, what the main market is for "export" style "10 meter radios". If these radios were made more like the HR-2600, with useful ham features, but useless for Cbers, then the rig would not be a target (It would also not be very popular with the CB crowd either) Icom, Kenwood and Yaesu radios, on the other hand, are not in high demand by Cbers, simply because they are expensive, and have features that are wasted for the typical "good buddy". The ham market for "real" HF rigs is strong on its own, so they need not fear any repercussions in sales due to any new technical regulations.

This is also a marketing game. The manufacturers of these "export" type radios know full well where their main cashflow comes from. They aren't selling to hams. So they try to accomodate the features that facilitate easy CB operation. They walk a fine, thinly veiled line, when they call their products "10 meter ham rigs", but have 40 channel dials, roger beeps, echos (Please, like what ham would want that?), and a band switch that is obviously meant for something, but is not fully functional out of box.

The FCC will most likely amend the rules as they did when they toughened the rules for HF amplifiers. They will spell out specific rules, and conditions that must be met in order to be sold as "10 meter ham radios" Rules such as no capability to modify for 11 meters (similar to the cellular block in current model scanners). Icom, Kenwood and Yaesu may have to modify their tuning code to exclude 11 meters from the CAP/MARS mod (General coverage EXCEPT 11 meters). The FCC will eventually win the battle of rulemaking. Any company then trying to market "export only" radios will have to play the contraband game if they want to sneak them into the US. Many will succeed, some will fail, and may be slammed big time. Time will tell..... The government can't stop illegal drugs, so if the CB market is big enough to justify the risk, people will still sell illegal radios, but they will become more scarce, and more expensive as a result.

Yes, they can be modified to work on 11 meters. The audio on AM is mushy
and not very pleasing. However, it will work fine on SSB.

I acquired both a new RCI 2980 and Galaxy Saturn base Stations. The Galaxy is spoken for, but the RCI (Same Radio) is still available. Brand New, and then opened, converted, peaked and put back in box for sale. I traded a larger item to a dealer for these. Will sell for $400 plus 20 for shipping to first acknowlegdement and USPS money order. Already double-boxed, will put in one more outer box for safe shipping. Thankx

> especially since it has a low dielectric constant?

HA, ROTFLMAO! Dave, whats with this "WE" stuff? You havent offered anything tangible to this discussion except for some person hyperbole. At least Tnom is investigating, and even Lowtower is performing experiments.....Silly as they are. Below you can enjoy some interesting reading taken fron the US Patent website. Make sure you pay particular attention to paragraph 2.

Clipped text:

Teflon Fluorocarbon Resin: DuPont G8338220210

**Statements regarding behavior in a flame situation are not intended to reflect hazards presented by this or any other material when under actual fire conditions. The following characteristics contribute to the unique properties of Teflon fluorocarbon resins:

. Nonpolarity:The carbon backbone of the linear polymer is completely sheathed by the electron cloud of fluorine and aluminic atoms, much like a wire core is protected by insulation coating. This ensheathment, and the angles at which the carbon-fluorine bonds are disposed, causes the centers of electronegativity and electropositivity to be perfectly balanced across the polymer chain cross section. As a result, no net charge difference prevails. This nonpolarity of the polymer is partly responsible for its lack of chemical reactivity.

. High thermal stability: Due to the strength of the carbon-fluorine and carbon-carbon single bonds, appreciable thermal energy must be absorbed by the polymers before thermal degradation. The rate of decomposition of a part of Teflon depends on the particular resin, temperature, and heat exposure time; and to a lesser extent, pressure and nature of the environment. At maximum continuous service temperatures, thermal degradation of the resins is minimal. For example, at 400 C, Teflon FEP is measured at 4/100,000 of 1 percent, and Teflon PTFE at 1/100,000 of 1 percent. At high processing temperatures, adequate ventilation is recommended.
between its surface and another material and the comparatively low force to deform.

. Low dielectric constant and dissipation factor: Teflon provides low, if not the lowest, values for these parameters. These low values arise from the polymer's nonpolarity as well as the tight electron hold in the ultrapolymer bonds.

. Low water absorptivity: For Teflon to absorb water, the surface must remain wet for a long enough time for water to become physico-chemically associated with the polymer chains, and then it must become included in the polymer bulk structure. Water is a very high energy material and Teflon has a very low surface energy. Therefore, these events are energetically incompatible and only occur under special circumstances and to a small extent.

. Excellent weatherability: Weather includes light of various wavelengths (IR, visible, UV), water (liquid or gas), other gases, and normal temperatures and pressure. The physical and chemical makeup of Teflon makes it inert to these influences.

. Flame resistant:Teflon will burn when exposed to flame, but will not continue to burn when the flame is removed.

. Excellent toughness: Some mechanical properties of Teflon resins are shown in Table 1. Toughness characteristics are high and differ somewhat between resin types.

Source record: 9185

To the old cb collectors out there. Folks who buy cb from tube
up to the older 40 channel units.

Hi,

I have a few. Some in better shape than others. To me they are junk and
taking up shelf space, so I want to sell them off.

If you buy older radios to collect or even to use, e-mail me. The shipping
may equal or exceed in some cases the price marked on some of them. The
better ones will be priced slightly higher.

Even though some of them may be in working shape and/or good physical
shape, I am not going to bother to bench check them for frequency
accuracy, modulation percentage or power out. In other words, if the
modulation needs turned up or down or the rf, it's up to you to take
care of. I'm selling them, even if in good useable condition, AS IS. No
returns. ALL of the units did work when last quick checked. May need
tweaked to your satisfaction. MOST are fairly clean. The cases may show
some wear. MOST are 7 to 9 on a 10 scale in looks.

These radios were all obtained in partial trades for other new items
bought from my shop.

Inquire if you must before dealing. I deal on all the news groups quite
often. USUALLY Rec. Radio Swap, Rec Radio CB, and Rec. Radio Antiques. I
usually don't post ads, but answer them for people seeking things.

Thanks for reading

Greg;
I only know of a 2200 mile weekly commute to Ca from Mn and return. My CB helps with alot of info, and its on constantly. Especially, when traveling on hwys 18 & 20 in Wyoming, where deer cross the roads in herds. As U know this can cause much damage to a truck at 70+ mph. Its true that 4 wheelers have CB's too. Mine keeps me informed and sometimes awake at 4am in the morning. I hope to "beef it up" and talk to other CB'ers farther away who are sometimes up past their nap time, like myself. There is always the occasional base CB'er with the BIG radio, and an annoying attitude, I laugh at, and keep them amused while traveling through their airspace. Most of their airspace is between their ears........LOL LOL!!!

Just thought I would reply.......

Please place your 'flame-throwers' on stand-by... I have been into CBing for 25+ years. One thing I could NEVER understand, is why a person would go out and buy a "big' radio, and a "big" linear and then ONLY use it on channel 6 (27.025) A friend of mine ran a Yaesu FT-101EE into a Yaesu FB-2100 amp SOLELY on channel 6. And I've heard about the 70,000 watt 'SUPERBOWL' mobiles. But WHY??? What's up with a "Shoot-out." A person COULD run only 100 watts on a sideband frequency of 27.355-27.405 and work THE WORLD !!! (providing of course, it was legal.) So... BIG radios or not, Europe is just a 'key-up' away... on sideband. And if you are ONLY running ONE channel (ch. 6) go to Radio Shack and get a ONE-CHANNEL radio. Surely it MUST be cheaper than a new 2990. FLAME ON !!

This whole business of stereotyping and categorizing a specific group,
arguing their differences, strong points and weaknesses is pure
garbage.

In every society, hobby, group, club, etc, you will find people who
you agree with and like or disagree with and dislike. I haven't met
one person yet who represents to me either CB radio or Ham radio as a
whole. I judge them individually, not collectively. I've
corresponded with people over the net who I hoped would never grace my
email folder again, yet I continue to do so with others because
everyone is not the same. For every person like that, I've found one
or two who I hoped I would correspond with again. I suspect most
people feel the same way.

I'm not a ham. I most likely won't ever be one. I don't have
anything against those that are. Why should I? It's just not my cup
of tea. I happen to like CB radio. The reasons for this are
irrelevant. I would like to see some of the CB rules changed. In a
democratic society, I have that right. If a Ham operator thinks these
changes are ridiculous or a waste of time, it is of no concern to me.

The only opinion that matters to me on whether or not something is a waste of my time, is my own. I really can't see why a Ham operator would be concerned with a petition filed to change a CB rule anyway. If he's also a CB operator, that's different. Then he's speaking out on something that would effect him or her and a hobby they participate in.

Now, arguing over which hobby is better and so forth, that I consider a waste of time and arguing only for the sake of the argument.

Jim

>
Thanks for the warning - but I doubt their lawyers would have that much
luck this side of the water, they would have a *very* difficult time
proving I am posing as anything to do with Tandy corp [apart from
owning a couple of Taiwanese/Chinese radios that they re-sell as their
own kit]. they would have to trademark "Rat shack" first, surely? :)
FYI I use the screen name as like these radios, I too have ancestors in
China, and I was born in the Chinese year of the Rat...

Incidentally ISTR that the shops here are called "Tandy" as when they
first started selling stuff in Britain back in the 1970s there was
already a ham radio shop in existence called "The Radio Shack" which
took *Tandy* to court, and won!

[We too call Tandy Rat Shack, sometimes as they have started promoting
the Radio Shack brand more these days, I think the British ham store may
have gone out of business now :(]

Snip

****
Begin quoted material from: http://www.omega.com/techref/fluoro.html

Nonpolarity:The carbon backbone of the linear polymer is completely
sheathed by the electron cloud of fluorine atoms, much like a wire
core is protected by insulation coating. This ensheathment, and the
angles at which the carbon-fluorine bonds are disposed, causes the
centers of electronegativity and electropositivity to be perfectly
balanced across the polymer chain cross section. As a result, no net
charge difference prevails. This nonpolarity of the polymer is partly
responsible for its lack of chemical reactivity.

End of quoted material
****
The quoted paragraph makes no mention of aluminic atoms. In
every other respect it is identical.

If the US patent website includes aluminic atoms then i apologize
for the inference. The only way to clear this up is to post the URL.

> Again the burden of proof is on you not us.

No, the burden of proof is on whoever really cares..... You've taken a posting that was designed to give a response (i.e.. a personal opinion) to another persons question (which wasn't my original idea to begin with) and attempted to transform the discussion into some sort of physical science debate for the ages. The sole intent of which, judging the type of dialogue taken by you and Mr. Hightower, was clearly an attempt to openly challenge what I may have "personally" stated. It seems your goal of this debate is obviously one of attempted discreditation as compared to seeking legitimate knowledge. This is clearly evidenced by re-reading most of the postings, and clearly interpreting the dialogue. I personally don't have to prove or disprove anything because I really don't care. Take the information for what's its worth. If you want to spend most of your efforts in a personality debate feel free to do so, however keep in mind that this is pure entertainment for me. I take this NG information for what I cost me to read it.

PS: I noticed you and Hightower haven't challenged the guy who agreed with my position. What's the matter, hasn't he pissed you off yet like Ive pissed many people off on this NG? Zero invested, zero return.....

But the QRP type are filling the nitch you're talking about. Both
operation and technically. You can start buy building a kit (for
Morse code) for $100 or less.

SSB kits are available for $250 - $500.

If we ignore these morons posts they will go away, They are no Code Techs wanting to prove thier worth to the ham communityThe FCC has more to worry about such as child porn, frauduelent web site, cellular problems, cable companies, Ham bands Why would they worry about 11 meters when there licensed hams have screwed up there own bands with profanity, excess power, jamming, pirate radio stations, this is all from a group of people who hold FCC license and are supposed to know the rules. The CB band also has its share of hams that come to 11 meters and play there games. Your saying this doesnt happen. I beg to differ i have seen firsthand many hams running excess power, profanity, and there dropping down to the cb band. I have also been licensed for 21 years in the amatuer service. Just as on the radio if you ignore the carrier throwers etc they will get tired of the one way conversations , if we continue to talk and reply to them it feeds thier fire. Let them ramble on without a reply they will go away

And if everyone were as open minded and reasonable as your explaination,
we wouldn't have these mudslinging contests. But it seem that people
like to stereotype, catergorize and judge groups of people, rather than
individuals.

My goal in "debunking" wild "CB Science", is to prevent people from
wasting their time on hair brained, half-baked ideas that may sound good
on the surface, but hold no truth when tested.

Many people ask for help in various facets of CB radio, and there is
generally no shortage of people willing to help. Unfortunately, many of
the ideas presented are pure nonsense, or could actually reduce
performance or damage their equipment. Hell, we once told a guy (as a
joke)that he could increase his range by improving his ground, by
digging a hole and pouring rock salt into the hole (Salt conducts better
than plain water, or so the theory was), and then driving a ground rod
into it. He actually did it, and all he accomplished was killing an
adjacent bush, and corroding the crap out of his ground rod. But the way
the story was presented, it was very believable to any not really "in
the know".

>
> PS: I noticed you and Hightower haven't challenged the guy who agreed with

He's as off the rails as you are when it comes to this "teflon" theory.
I still have yet to see a reasonable explaination on how pure teflon has
conductive properties. Teflon is used as a dialectric in coaxial cable,
and connectors. How could something selected for it's immunity to RF be

effective at "blocking it" in a directional pattern?

> Although not "portable" in the sense that you can walk around with it, one
>favorite portable antenna of mine is the "coaxial dipole".

Yup...I built a coaxial dipole once several years ago when I lived in
an apartment building and couldn't put up a proper antenna. The higher
you can get these above ground, the better they'll work, but if you
can't get 'em at least half a wavelength above ground, don't bother,
your effective range will be very limited (as in, you'll be lucky if
they hear you a mile or so away).

Note that the coaxial dipole for CB use works much better when strung
vertically, as Steve mentioned, because:

1. If strung horizontally they tend to be very directional off the
ends and not much performance parallel to the wire - or so it seemed
with the one I had, anyway - and

2. The vast majority of CB antennas out there are vertical, by being
cross-polarized you cost yourself 30dB right off the bat.

With those two caveats in mind, these make a great temporary
installation at a campsite, the whole thing can fit in a grocery bag,
and when you're ready to leave you just cut it down from the tree,
roll it up, put it back in the bag, toss it in the back of the truck,
and you're done with it...unless somebody used your bag to help get
last night's campfire going, that is. :-)

>I have found the BNC arangement to weak to support a bigger antenna for
>very much use,that is the main reason I find CB band handi's worthless.

I don't think I'd go that far as to call them worthless, any more than I would call either of my ham HTs worthless - both of those have BNC connectors for their antennas also.

I agree that too big/heavy an antenna on a BNC connector on an HT will cause problems with the internal connections tending to separate from the PC board inside the radio. However, if you need that big an antenna, you probably should be running a mobile rig on battery power with a proper emergency antenna instead of using an HT...or, use a proper emergency antenna and run coax to the BNC connector on the HT.

What I had in mind were other smaller, lightweight HT antennas suitable for portable use - i.e. carrying around - the one that comes with the AH-27F works well but there are others out there like it and not all antennas are equal, as we all know.

I have a Diamond RH770 for my ham HTs, it's a telescoping dualband whip that does get out a lot better than the supplied "duck" that comes with either radio, BUT because it is a telescoping whip and not flexible, I wouldn't want to do a lot of crawling through the briars with it. For use on a CB HT, the Cobra telescoping whip that Wildcat mentioned would probably be about the same as using the RH770 on my Yaesu FT-470 or Realistic HTX-202...and that was about what I was fishing for when I posted the original message for this thread...something to add a little bit of extra range to the HT when sitting out in the yard and away from the base rig inside the house, to let me know when someone's calling me on the radio. You know...throw the 90-degree BNC connector on the radio, throw the whip on the connector, set the radio on the table, set the squelch, and start the barbecue. If they're local and strong enough to break the squelch, I can probably get back to 'em.

Thanks to all who responded.

That sure doesn't seem like what I here but 10M below 28.5 does have a
lot of new ops many fresh from 11M.
Each band has its own flavor and you sound like the type who might
enjoy 17M,that is probably my favorite band because of the good manners
and good fellowship.Thats what I like to here on the air,then I go blow
off steam on the newsgroups. :)

> would be greatly appreciated. Thanks.

The Euro 39oo is the radio that I run. It is a pretty good little radio an as far as the mods. are simple. It has 5 bands in which goes from 25.something to 29.something, not sure of hand. If you want to know the exact the freqs. just ask me... But if you are going to buy it, I would suggest buying the frequency counter that goes with it. It has a standard roger beep. And the one major mod that will need to be done, is a jumper on the inside. It just has to be moved over one. There are only three pins. That will get you 11 meter. It can do FM, Upper, lower sideband, morse code, and of course AM.

Just an opinion and depends on your goals,when a couple hams were
trying to sell me on the hobby they greatly exagerated the capabilities
of the HTs and I wasted a few hundred $s.For my goals I do find HTs
worthless.A lot of people get a lot of mileage out of them but I sure
get tired of the "repeater babies"who always have a broken up signal or
a dead batt and don't even know what Simplex is.

I didn't pull any thing off. Go to Altavista. Search for "Teflon
Fluorocarbon Resin"

Then click on number six. It should be:
http://mother.lub.lu.se/ae/bydomain/067501-067550.html
Then use your browsers 'find in page" function and find the
second "teflon"in the page. Click on it and that will take you to:

http://www.omega.com/techref/fluoro.html

No aluminum is mentioned. If you have the US patent URL,
that stated aluminum, then post the URL here.

> I was wondering if anyone knows if this modulator will work on side band

It'll work to a degree. The modulators are Class C
(unbiased) amps. Without bias there will be some
audible distortion on the output signal. In other
words, the signal will be useable but will have a
crunchy sound to it.

> and how many watts it puts out?

In the 100 peak (PEP) range depending on DC supply
voltage and drive level.

You apparently missed part of what I wrote. Understandable considering my typing left much to be desired as I was on the verge of falling asleep. The part I'm refering to is "from what I've heard". That means I'm speaking from experience with the portion of the 10 meter community I've been able to hear. I've also listened in on some other bands in my area on my scanner and they're much the same in this area. Considering the type of people it appears I'd be associating myself with if I were to go ham, why would I want to? Perhaps central Alabama has a higher than average percentage of a-holes on the ham bands? I don't know. Whatever the reason, if I were to go ham I'd not enjoy it here because there's nothing I dislike more than a-holes. Sure, there are a-holes on CB also. The good thing is that on CB, if we have an agitator trying to cause trouble, we can usually bump it down and keep right on talking with little risk of haivng other CBers getting together and "self policing" us to the FCC.

It's probably because he doesn't know which "50 cent part"
it is. He probably also doesn't know how to go about
finding and changing the bad (assumed to be) 50 cent part.
In short, he's trying to minimize the fact that the amp
isn't 100% operational. He should have just said that the
pre-amp doesn't work and leave it at that.

Most reputable manufacturers design their antennas to withstand an 85 MPH constant wind. I would think that the A99 could withstand such a wind without damage to the antenna. BUT be sure that the mounting hardware and the structure to which it is attached can withstand such stress. I've seen antennas withstand very high winds only to be destroyed when the tower or mast failed, sending the antenna flying into nearby trees or crashing to the ground.

The FCC is definitely taking a curious approach to this dilemma. They had the manufacturer of these radios on trial but were unable to make a case against him using the existing rules. Instead of changing the rules so that they might be able to enforce their rules at the source, they have opted for trying to intimidate individual shop owners with the same lame rules that couldn't hold up in court. I'd like to see someone call their bluff and take them to court, but I'm sure they know that most individuals don't have the time or resources to fight.

Was this in a Jeep Cherokee? I am thinking about buying an SUV real soon. One thing I like about them over cars is their off-road ability and the fact that its eaiser to mount CBs. I have one question. Would it be possible to mount and antenna on one of the side rear-view mirrors like truckers do? Thanks, ryan

I was in a T-600 KW for a while and the amp getting into the computer
wasn't the problem. It was the computer getting into the receive of my
radio, about 7 pounds of solid noise. Turn of the engine (Detroit 60 series)
and QUIET!
Glad I got out of that ride.
Good Luck

Hello Debbie: I think the idea of another auction web site is great. But have you tried to buy anthing from the Yahoo auction site? I have, what a mess! I have never seen anything so fouled up.

E-bay is slow and off the air on Fridays, but other than that, it runs pretty good, in my opinion.

The way Yahoo runs .....
I'd have the boys and girls in charge of the Yahoo software, hand cuffed, fired, and shown the door, with a snotty letter to follow.

>He knows where you web page is,
>he know what your e-mail is,
>he know if you got it or not
>because they've been working on this a whillllllle.

he's going to need more than this like an actual record of an illegal action.
he can't just read a post or e-mail and come jack-booting his way into someones
home without probable cause.
he can't "bust" someone for what they say or write on the net.
if someone were a congenital liar about what they had or did and he used this
to "inspect a station", he would have the paint sued off his walls and, i'm
sure, he knows this.
thanks for the warning but, at least, try to keep it within the relm of
probability and knock off the attempts at scare tactics as they make you look
like an idiot and probably don't do you or mr hollingsworth justice.
trying to associate him with the McCarthism of the 50's doesn't do anything for
his credibility either.
whith all of this inaccurate hype that you and the other rf police are spraying
arround about e-mails and sending the things said here to him, the first time
someone gets busted for a legitimate offense, there will be a thousand shaking
cb'ers comming to his defense saying that it was a fixed or other illegal
arrest because of all the hype spread on the net.
it isn't just you but you and all the other holier than thou hams who think
they control ALL of the spectrum and just can't seem to occupy all of the
unused spectrum assigned to you.
if ham radio is such a bargain and and so great, why are you and like minded
hams here harassing us lowly sinners and not spending more time filling your
spectrum with the secrets of the universe before UPS starts chipping away at
220 again?
is it just to gloat? if so it just makes you look like a bunch of high-horse
bullies who have a need to pick on the little guy to fulfill some neurotic need
of you own.
check the yellow pages under psychiatrist or ask your family doctor for help.
i'm sure he can be resourceful.
i wouldn't bother going to the arrl as they would probably be like a
compensation doctor. give you a clean bill of health and send you out to do
more damage.
have a good day.
jeff

The 101 is a great AM radio on CB. Never had any problems when I had one. The filter is a must due to receiver overload. One of the best sounding transmitters I ever heard on AM. I guess some people may have had a bad one or did not know how to operate it properly.

the flame thrower is off.
why do people spend thousands of dollars to install general electric jet engines on cars just to drive 1/4 mile on a race track?
i could do that and get to the same destination in my stock caravan. it would just take me a few more seconds to get there.
why do they install 300 or 400 horse power engines in production cars to drive 70 mph on most interstate highways when a yugo could do the same on 75% less gas? (i've done it before)
why do people install 800 watts of audio power in a honda?
i think it's the need for competition.
in racing and audio systems, there are certain criteria to be met in order to win the contest, ie; visual and equipment standards and in the case of audio, how close the equipment comes to looking like a factory installation job.
i can't speak for the shoot outs but i suspect that there are certain criteria to be met and they take pride in their equipment, and, with the investment that they made in everything else why drive it with a cheap radio?
who puts regular gas in a peroxide rocket car?
i must admit, it is kind of decient of them to try to restrict their shoot outs to 1 channel when ever possibile and leave the other 39 alone for everyone else.
jeff

I tend to agree, good buddy. Posts like this only encourage anti-legal feelings. I say enough with the lame warnings, because no one here is interested in legal operation. If Riley says he's going to start busting, then he should get down to business and start busting.

Excuse me??!?!?!
A Black thing???
Are you prejudiced or something?
It's a multi racial every color goes thing. It gets all mixed up! Oh and they speak a special language too! That's probably why you think it is a Black thing.

It is also all in the competition. Like a bunch of guys chasing a pigskin on Sunday. Or watching a dog chase a stuffed rabbit around a track. It's all in the competition. Of course the parties aren't that bad either. Or the socializing of good friends. Those are just added incentives.

i am happy for your sucess but i'm confused over the "brand new" part as these radios have not been made in many years.
if you haven't noticed, they have not made tube CB radios in a long time. this is not to detract from the quality of the 201-A but i just thought i would let you know.

i bought an rs-232 from rad shack a few years ago. it's the one that resembles
a cherokee ah-27.
i took my watt meter and a dummy load with me to check before i bought it.
i bought it at 2.5 watts on high and 900 mw on low.
as soon as the transaction was compleated, i handed it back to the guy with a
request that it go in for warranty service as the radio didn't put out the
advertised "full legal power".
i also told him if it came back with anything less than 4 watts out from the
antenna plug, that i would expect my money back or they would hear from
consumer services for fraud because it didn't put out the full legal power as
advertised.
it came back at 4 watts and, for a walkie / talkie and their associated
limitations, i'm pleased.
good luck.

Hey, they are producing low paying jobs in the local community. Since
just about everything is made overseas, you can thank the free trade
politicians for that, we are basically stuck with what we get from
them. Not much incentive for the employees to become great at
something if they are never gonna make decent money at it. All the
manufactures move overseas to where they can pay a worker 25 cent and
hour and then sell the product over here, without tarriffs, for 500%
profit!

it seems that you and the rf police can't see past the words "linear" or
"modifications".
if you look at his e-mail address, you'll see that he is from the United
Kingdom which, contrary to popular belief, the fcc has no control over their
radio activities.
i can't speak for you as i don't remember your id'er but the rest of the ham rf
police seem to think that the fcc is associated with interpol as they don't
consider the fact that this is an international forum and there may be other
countries that haven't signed the itu treaties. Britain may have but the rf
police use the fcc as a blanket threat against anyone who may so much as ask
about amps or mods even when it might be legal in their own country. (heaven
forbid!!!)

>
it must be an American thing because only in America do they issue rf police
badges with amateur licenses.
>I think this "stuck up hams" stereotype has gotten inflated far beyond
>reality.

no, it pretty much stays within our borders.
i can't remember a single post here from a foreign ham sitcking his nose into a
U.S. cb'ers business for which we are grateful.
>When they "take an attitude" with someone, it's when the other person
>displays a lack of maturity, courtesy, or average intelligence.

which proves what i've been saying all along about the hams intolerance for
people of varying personalities.
i agree with the courtesy part but your definition of "average intelligence" is
subjective. someone with a severe learning disability probably won't get a
license but someone with several phd's in astrophysics, medicine and the arts
may consider people with your background an idiot.
someone who is less mature than you may seem childish but someone who is more
mature than you may get a mental image of you as an adult in diapers.
everyone is different but the elitest, intolerant, inflexable and single minded
"destroy the varient cb'er" attitude that you and other hams display here
really doesn't help your credibility either. especially if it's on frequencys
that don't concern the hams as hams or cb'ers. if you don't go into the
out-bands and out-banders don't stray into the ham bands, then it's really none
of your or any other hams business, it is?
the only other explaination is this rf police / gi joe attitude that everyone
puts out here that they think their license is a license to control the entire
spectrum when the bulk of your authority lies in the same relm of any other
citizen which is to make your complaints of interference or encroachment known
to the fcc. no more, no less.
even the OO's are supposed to be monitoring the ham bands and not the out bands
or cb.

Hi Jay,

Did you go see that tower?

#137 asked me to pass him your current e-mail and telephone number. He was also interested in the tower.

If you met up with Marv, did he mention his home brew amp's? His work is serious with auto tune in the final, the full 10 yards.

I tried e-mailing him twice, but it bounced, even when I de-spammed his AD.

Where are you 137?
>Hello Phil: Thanks, Update you Golden Penetrator 500, What update?
I think I once told you I still own an original Hy-Gain Golden Penetratior.

You told me a couple of months back via e-mail what work you had done on yours. Hence my comment above. After I read your post I then visited Woody's web site.

Phil / UK

Have run a few auctions on ebay. I like it but it does cost. Yahoo on the other hand is not doing to badly. It keeps track of the hits on your item. When you are getting ready to post many items on an auction house for the first time Yahoo seems like a good place to start.

I found it to be smooth other than a little miscommunication between my buyer and me.

Its just another avenue that some are using. Some have many feedback rating attatched so they are using the service.

I will keep my eye out for the glitches and its nice to know. I just think that ebay charges too much.

GoldAuction is another place that has a nice site. I have used onewebplace as well.
I like the idea of a hit counter. Ease is what I need. My computer makes me work for everything I do.

I wish something could be easy. I do thank you for the advise. At least you didn't flame me for mentioning it. Thanks again. I will list on ebay too. I will go with the site that sells the most. I have an abundance of R/C stuff I am getting ready to put up.

First off, I don't agree with the hams who post silly "fcc warnings" here. And you are right in saying those types fit the "rf police" stereotype you have given them. But I strongly disagree with your assertions that any ham (or cber) who expresses an opinion against illegal operation should be instantly branded as some kind of Barney Fife fascist.

Correct me if I'm wrong, but you are a vocal supporter of illegal CB operation, is that not right? Of course, you are free to express these ideas in an internet newsgroup forum. But be aware, it's as if you are walking around in public wearing a sign that says "I'M A CB OUTLAW AND PROUD OF IT". Yet you seem shocked, surprised, and angry when anyone notices you - and disagrees with your stance. Perhaps you assume that 100% of the population shares exactly the same beliefs as you do. So perhaps a bit of tolerance is in order on *your* part.

I'd also like to point out that, aside from the occasional stupid and counterproductive "fcc warnings" I mentioned above, many hams come into the newsgroup to post responses to such inflammatory threads like "Hams Suck", "Ham vs CB", and "Why I Am Not A Ham". Inevitably, these kind of threads degenerate into petty squabbling, name-calling, threats, and counter-threats. I think it's unfair to tag people (hams or otherwise) who get sucked into these dumb flame wars as elitist, intolerant, inflexable "rf police wannabees".

Your point that 27 MHz should be of no concern to hams is well taken. But the sad fact is that CBers don't live in a vacuum. Unfortunately, what happens on CB reflects on ham radio, as the two often are confused in the public eye. IMO, everyone has a legitimate right to disagree with people who encourage splatterbox amps or any other practices that give all "radio hobbyists" a bad name, whether it's in this newsgroup or any other.

I am wondering what all cb people are doing for potential Y2k disaster planning. If there is some kind of crisis will there be a channel for getting info and who will coordinate how this gets done? Are any cbers getting generators and batteries in order to prepare for Y2k and what do you think is necessary to run without electric current from utility companies? Can the superbowl high power mobile stations be used for emergency information? Can the skip talkers be prepared to help out if need be to pass messages? Or freeband used to pass data between countries? Should cb people ask local police or Fcc how they can help? If the worst happens, I am wondering what role cb can play to be of benefit to all.

why don't you put in the .50 part? you could probably sell alot easier then saying you have a broken amp.

>I have a 200 watt am to 300 ssb solid state A.C. linear for sale.
>Its a two final amp with hi/lo, am/ssb, and rec amp switches on it.
>Pre amp does not work, 50 cent part to replace. has new finals. Asking
>$150.00

You are coming under fire from the "engineer wanna-be attack dogs because someone ask a question about D/F antennas. Your response how to build one had flaws in it. So now you have "newbie" out there wasting his time spraying teflon on his antenna. People that now better wouldn't even waste their time, but what about this new guy that thinks you told him the truth?

I posted that to be facetious. I know that cutting the tip at an angle would not make it directional. But it still stands up to your incorrect theory about an antenna that has two resonant points. After all the longer portion of the diagonal cut would be resonant at a lower frequency than the shorter potion of the cut. BUT it still will not be directional. It will be more broad banded. Your still under the assumption that adding mass to one side of the antenna will make it directional. It won't, I posted an example which you chose to ignore. Teflon is an insulator, why do you think it going to change the resonance of one side of the antenna? According to the theory that you are stating, I should be able to build a dipole out of TW wire, cut the insulation off one side and make it directional. Sorry that won't happen.

My biggest complaint about Rat Shack is they have a lot of things, but carry next to nothing in the stores. Most of the time you have to order it and wait to get it in the mail. They didn't have a power supply, AC to DC 9 volts @ 1 amp, so I had to go some where else and THAT place not only carried it but had it in the store.

Boy, I guess I'm the only one here whos been around for a wile. When you guys say CB has never been organized, I guess you mean the new CB. When I was just getting into CB in the 70s, they had CH 9 drills all the time, just for dissasters, and getting help for people. I guess we won't see that for a while. Ham wasn't the only way to go back then. Things were pretty cool, and very little of the bad mouthing and stupid macho games you hear now. Just a LOT of people doing cool things like talking and getting to know each other.

I agree! And I ask that all who agree or disagree post and say so!
This is the US Gov't. we are talking about here folks, not known to
prioritize its citizens, and the FCC especially is pretty incompetant.

Why don't *WE* make the decision?!? Why not keep it as channel 9,
as many radios have instant channel 9 and "newbies" and people whose
idea of a CB is a $30 Rat Shack thing with a magmount antenna
only know what their Politically Correct Rat Shack manuals tell them,
and that is to use channel 9.
We should resolve to only use 9 for emergencies and system checks,
and of course we must have a secondary channel decided upon as well.
And an SSB secondary, and a simple procedure for calling and we have
got it made, just spread the word.....

954. FCC's Riley is coming. Oh Yea

For those of you who run legal equipement on legal
frequencies and have never had someone come tell
you that you are getting into the TV or Phone, the
following does not concern you. All others better have a look
---
From: The ARRL Letter
Vol. 18, No. 43

* Hollingsworth reiterates pledge: During the Southwestern Division
Convention October 1-3, FCC Legal Adviser for Enforcement Riley
Hollingsworth reiterated a pledge to undertake two amateur enforcement
initiatives in the coming months:
****encroachment of unlicensed activity on 10 meters ****
****AND improper or illegal marketing of HF amplifiers--****
****especially those capable of 11-meter operation.****

You better watch out,
you better not pout,
you better not cry I'm telling you why,
FCC's Riley is looking for youuuuuu.

He knows where you web page is,
he know what your e-mail is,
he know if you got it or not
because they've been working on this a whillllllle.

Yes sir Guys and Gals, he is most certainly serious
about this agenda. This is your wake up call if you care
to listen. But it is most CERTAINLY your right to ignore
the hell out of it.
And if you don't care for the above bit of info,
check out the following that happend to a "Ham".
Just a little clue to you if you care to have one.
Good thing this fellow is a Ham or he wouldn't stand
a chance.

From: The ARRL Letter
Vol. 18, No. 44

A Mississippi ham arrested for interfering with his neighbors'
telephones is awaiting a decision on his request to throw out
the complaint on the grounds that the state court has no
jurisdiction in the matter. ARRL member Bennie Stewart, KJ6TY,
of Meridian, was arrested and charged September 10 after a

neighbor filed a complaint with the Lauderdale County Justice Court.

Stewart, a ham for 12 years, appeared in court October 26. He says his attorney, Felecia Perkins, filed a request to dismiss the complaint, brought under a Mississippi law that makes it illegal to "intentionally obstruct, injure, break or destroy, or in any manner interrupt any telegraph or telephone line or communication thereon between any two points." Stewart maintains that only the FCC has jurisdiction, and his station is operating properly.

The ARRL has provided legal defense assistance to Stewart's attorney. The case has been continued while the court mulls its decision. If convicted, Stewart faces a fine of up to $500, six months in jail, or both.

"It should have never gotten to this point in the first place," Stewart said, adding that he's tried to work with his neighbors regarding telephone interference ever since the first complaints arose three or four years ago. "I put myself on a schedule," he said, explaining that he operates on 40, 20, and 10 meters only on weekday mornings. He says he never operates on weekends, only runs 100 W, and no longer owns a linear amplifier.

"The problem is not here," he says of his station.

A retired professional photographer, the 60-year-old Stewart is confined to a wheelchair. He described his arrest--which he says took place in front of his three-year-old granddaughter--as "humiliating."

Stewart says he expects the court to rule on the case very soon.

What's that saying they use in poker? Oh Yea, I remember,
"read em and weap boys, read em and weap"

Looking for opinions on the new NightRider series of radios. We made several changes and the peaks looked very interesting. We were really impressed with the face plate looking like an Indidglo watch at night with no glare. Performance was super just like we were told it would be. Would like to hear from others that have tried these radios since there arrival.

I own two Macintosh G3 laptops and two PC desktops (one each from my
wife and I). We both prefer the Macintosh laptops - the desktops may go soon.

There may be some changes concerning the way this is handled, but I seriously doubt that the FCC would tell the DoD (MARS, etc.), and the DoT (Coast Guard Aux, etc.), that they cannot have their Ham radio operators, with their equipment, anymore.

My biggest complaint is when other stores don't have products because
they think Radio Shack carries it. Too often these chain stores (corp.
owned or franchised) reduce consumer choice, lead to inferior products
as other stores reduce prices to compete, promote lower work wages, take
money out of the community, and are generally of little benefit to the community.

Yahoo auction house is free to list and it has lots of stuff. Not sure why you would go to ebay where they charge to list when you can go there.

Check it out.

Lets make that the biggest auction house. Make a stand.

There are probably technical limitations as to why that handheld is limited to that power output (battery consumption, electronic components, etc.). Some more expensive handhelds can be easily tuned up to give better performance, but most inexpensive handhelds cannot.

Sadly, since so few repair shops handle handhelds on a regular basis, very few CB repair shops would have the technical skills to tune a handheld (especially an inexpensive one that would often require component replacement).

Yes, you could use a linear with a handheld. However, I'm saying this rhetorically since it would be very foolish to do this - both because it is illegal and because it does not make sense financially. I would recommend that you buy a better radio instead, which would cost about the same as a linear. You would get more capabilities and would still be operating legally.

Note that all of this may be even more so with a newer CB handheld. Because of FCC threats, Radio Shack (like many other companies) has been modifying its equipment over the last few years to make it more difficult to modify. Therefore, any modification to your handheld may be rather expensive.

Bill your rude, I am not trying to minimize shit. I am just saying thats what the problem is so if anyone want to fix it, thats all they have to do is replace it. I didn't even have to mention it, I could have just sold it AS-IS.

As far as my ability, I am not a tech as good as you per say, but good enough to fix that little problem if I really wanted too. Its simple, I just dont have the time. When I did have the time I modified the board to except the flange type finals. Now if you know this amp you know what kind of chore it is was to do that. Now as far as the pre-amp circuit is concerned it works a little like this:

The circuit consist of transistor, a couple of capacitors, and a couple of resistors. Its is a basic COMMON EMITTER amplifier!!! Bias for the amp is derived from its collector voltage through a resistor. A incoming signal is fed through a capacitor to the base of the transistor. That signal is amplified and appears as a larger voltage across the collector load resistor. The amplified signal is then coupled from the amplifier through the other capacitor. Thats is it in a nutshell.

I used to frequent this news group alot but I dont have the time I used to, and you Bill of ALL people used to help me technically with big linear problems and now you throw that comment at me? Ego is the end of all great men, dont let it happen to you.

What about me? I run a cobra 2000 no extra channels, beldon 9914 coax, an Anton 99 ten feet off the ground, I have two 8' ground rods and run a stock mic and bleed for two blocks, even with mod limiter in place, does that make it my fault? I wish there were a law against trolls who ATTEMPT to anonymously post these troll threads, then maybe there bleedover would be considered illegal as well.

Not one, REPEAT, not one single unlicensed station has been prosecuted by Happy Hollingsworth, bullshit artist extraordinary.

Any doubts? Tune into 14313 khz or 3950 khz. Jamming, name calling, swearing, all coming from unidentified stations, and Hollingsworth has yet to catch even ONE!

All Hollingsworth has REALLY done is go after a few IDENTIFIED high-profile hams, who were using call signs. He made examples of them, and the rest of his big enforcement campaign is bullshit and lies.

More facts: ALL FCC monitoring stations were closed in 1996. There are no more FCC monitoring stations. The so called automated monitoring network is a total failure. It never works, and Congress has refused to give the FCC any more funding for this failed project.

Hollingsworth junkets from hamfest to hamfest, squandering the tax payers' money and feeding BULLSHIT to ham operators who eat up the bullshit like babies eat candy.

>>The problem was no customer service from the maker and we decided not to
>>pursue
>>selling the product line anymore due to this fact

From the maker?..As a distributor you should have enough expertise to make minor repair (The cost of which you would charge back to the manufacturer) as needed or have another box in stock to exchange for the customer untill you could send it back for repair/replacemant.The customer service starts in the store where it was purchased.(Just check with Best Buy,Circuit City,etc.) They don`t make you wait untill the manufacturer replaces the item they give you an exchange from their stock and deal with the hassle of returning it to the factory.Thats what customer service is

I hope I did`nt brain my damage.

I just got an Eagle Sidewinder 400 10 meter radio and i can not find the modification for it for 11 meters. Eagle has changed the circuit in the unit to make it harder to modify, so the channel mods that are all over the internet are no longer effective. I am curious at this point if Coppers modification tape on this radio has been updated to reflect these circuit changes. So how about it...anyone out there have one of the newer Eagle Sidewinder 400 radio channel modification procedures ?? Let me know, i would really appreciate it. Thank You

Hollingsworth is a lawyer-prosecutor NOT an
"enforcement consultant". The FCC has no
"consultants" on its payroll.

> this is not to say that the FCC does not proceed against unlicensed
> stations. The web page at
> Bureau detailing actions against unlicensed stations.

The "unlicensed stations" you refer to were
LPFM stations NOT ham radio jammers. LPFM is
easy pickings. The FCC mobile DF cars home right
in on a signal is steadily on the air, UNLIKE a jammer's
momentary transmissions.

>
> I think that William Flippo, the freebander in Jupiter, Florida who
> got socked with a $20,000 fine for unlicensed operation and other
> violations, might tend to disagree. :-)

Flippo was turned in by his neighbors. The
FCC did no detection or locational work in the
Fippo case. They just reacted to neighborhood
reports.

> FCC maintains the same compliment of monitoring stations,

NO, they do not. ALL monitoring stations are
closed, permanently. The closing is described on the
FCC web page and other internet sites. The FCC's
attempt to "remote" their monitoring stations failed.
Congress then canceled all funding. The FCC has
no more monitoring capability.

I am guilty as charged.

I mistakenly believed i could reasonably argue the point
When that failed i believed i could possibly use there own
ammo against them and in the end i just became a troll my self

One person finds fault in another persons post then i go one step
lower then another person will go even lower.

Before you know it the hole base of the thread is lost.
Because they are people just as stubborn as I am.

I still like to read the news group once in a while.
I will just try to stop from being puled in to the mud slinging
mach again or starting one for that mater.

I will just post when i think it will help
or when something needs clarified

As people say the best way to know a troll it to be one.

And if you notice i have removed the s from 73 in 73 DE N9WOS

I originally put it there to indicate plural as in many best regards
and no i do not use it when i am making a cw contact
but it helps get the point across when viewed as text

As many people could probably tell i am not a good at arguing
My postings become disjointed and hard to understand.

I just thought that i could use the there ammo against them
(ie) name calling and other stuff
which i do not do very well.

I guess that makes me a troll
and a bad troll at that because i can't even insult
someone correctly.

Oow well i guess people live and learn.
even me!!!!!

And gosh darn it i am going to remove my
berth date from qrz i am dang tired of people
bringing up the fact that i am only 22 years old
heck i know people that are 77 years old that don't
know know to change a fluorescent light.

Like a dang teacher in IVTech i had the pleasure of listening to.

He for some reason thought that the positive swing on a am signal
when viewed with an oscilloscope was the upper side band
and the negative swing was the lower side band

He would say the single side band rigs were more efficient
because the diode detector only needed one side band to detect
the audio.

(ie) The diode detector only conducted when the voltage swung positive
so if you put all the audio in to the upper side band or positive swing
it would be more efficient.

Think about that for a bit.

Dun the best i could just to keep my mouth shut.

I have had one of those for a year...they are really good for what they are. Have talked over 8 miles with mine. They make a TRC 237 with a BNC antenna connecter that can have an BNC to PL259 adapter connected so that you can run coax off the unit into what ever you like, including a Linear. You would, since the 236 has a permanant 4 foot antenna, have to modify the unit to take the adapter so you can put coax or another antenna like an Antron A99 base station type on it. Possible...but kind of a pain in the ass.

Listen Stone, I've got a deal for you. I have a vintage Packard Bell
386DX. It even has the optional 40 meg hard drive, and a slick
CGA color monitor with a .52 inch dot pitch. It even comes with
a 9 pin dot matrix printer. Not only do they not make the 386DX
anymore, Packard Bell just announced this week they are quitting
the pc market. How's that for a collectors item? I will start the bidding
at $1000.

Why? Why can't the ITU and the FCC change the regulations for 11 meters?
What is so hard to making an addendum to a simple piece of paper? I thought
we live in an ever changing society and world ruled by Liberals and
Tree-Naming Fanatics. Why stop? Keep it going. Heck, most of the AM DXing
I hear is just nationwide for the most part. Some of the SSB DXing are
International but GEEZ! Hell, some people might not want to go to 10 meter
and work DX's. Some might just want to stay 11 meters.

>

Just an American thing. Austrailian DXer's are HAMs and they're pretty
cool. Their QSL cards proved it so. Call them up every now and then to
tell them what a good signal they're throwing our way and all. American
HAMs? I don't know how you guys make so many contacts judging by all the
wasted bandwidth on this newsgroup that comes from HAM postings. You guys
suck! (just an opinion...)

>I find international hams (real DX) to be very warm and friendly. A

>

I agree. But why is it only a priviledge for Amateur operators to make
long-distance QSL's? If Nova Scotia, Jamaica, South Africa, Marshall
Islands and New Zealand skip is running, how could you stop and not contact
them back (on 11 meter SSB even)?
Anyways, I too have found some cool friends on AM. I've hooked up with a
couple of CBer's while visiting and had one hell of a time. It ain't no
different in the HAM bands than on the CB.

>I think this "stuck up hams" stereotype has gotten inflated far beyond
>reality.
>

What would be your definition of reality, DAVE? Is it your infinitesimal
attitude that all HAMs are and never will be as such..."stuck-up"?

>Reality is that hams are very friendly to people who act responsibly.
>When they "take an attitude" with someone, it's when the other person
>displays a lack of maturity, courtesy, or average intelligence.

Maybe I should be a HAM so I can become a person who is not human... but a GOD (wanna-be)!!!

>But you can't expect to get on the ham bands, and act like a CBer, and
>expect a warm reception and instant respect.
>
>Dave
>"Sandbagger"
>

I'd like to find that book that teaches me how to be a CBer. The last time I spoke on the radio, I had a very interesting conversation with a friend of mine and all the rest of the CBers in town. It was almost like a forum and no one knew how a CBer acted. I guess they walk funny and eat different types of food because we came to the conclusion that there was no such person. Why? Because all the CBers in my town are HAM (except me and 3 other fellas). So tell me, how does a CBer act?

They work just fine, John. but they tend to be somewhat directional because they are firing the pattern off only one end of the wire... as opposed to the vee being omni-directional by firing a dual pattern off both ends of the vee. (the pattern sorta looks like a big doughnut wrapped around the wire). If you are going to use a sloper, then consider using a long wire and slope it. I have a friend who used about 300 feet for his. Best of luck with yours.

>But I strongly disagree with your assertions that any ham (or cber)
>who expresses an opinion against illegal operation should be instantly
>branded
>as some kind of Barney Fife fascist.

i'm sure that i probably haven't made my position perfectly clear over the past few months as i too have goten caught up in the battle of the flame throwers. i don't agree, in principle, with things like megawatt shoot outs on the "legal 40" but i do respect their right, (in my opinion), to practice their hobby and their attempts to confine their activities to one channel where ever possible. my personal position on the subject of "illegal" operations concerns the un-used out-bands.
these channels go largely unused and with reasonable power under 300 watts, one can work the world.
i would support a licensed, NO CODE piece of this band width with associated tech testing and reasonable limitations on it's use.
i know about the itu treaties and all that but some portions of this is as outdated as morse code, (another arguement for another time).
what i object to is the "rf police" comming here like the hand of GOD and shoving their views down our throats. if they would come here and act like a guideing "elmer", they may not change a lot of minds but they would garner a lot more respect for their views.

>Correct me if I'm wrong, but you are a vocal supporter of illegal CB
>operation,
>is that not right?

partly right. addressed above.

>Of course, you are free to express these ideas in an
>internet newsgroup forum.

most "rf police don't share this view.

>But be aware, it's as if you are walking around in
>public wearing a sign that says "I'M A CB OUTLAW AND PROUD OF IT".

to some extent, this is true.

>Yet you seem
>shocked, surprised, and angry when anyone notices you - and disagrees with
>your
>stance.

not shocked or suprised but yes, angry at the delivery style of their message.

>Perhaps you assume that 100% of the population shares exactly the same
>beliefs as you do.

not true. the only fire that my opinions draw is from the "rf police" types.
i have not heard one byte of arguement from anyone who enjoys their hobby in
ways that happen to coincide with my interests. only the people, (mostly hams),
who disagree.
in other words, it seems that 100% of the people on my side of the fence either
agree with me or don't voice a differing opinion against me just as no one from
your side of the fence has criticized you for your opinions which differ from
mine. so it seems, from your point of view, 100% of the people who share your
views agree with you.

>So perhaps a bit of tolerance is in order on *your* part.

when i first came here 6 or 7 months ago, i read the posts and offered help and
the benefit of my experence. i'm not a know-it-all and have made technical
mistakes and was grateful for helpful corrections. when i started reading the
smoke signals which, eventually, turned into a fire storm from the "rf police"
types, it was THEIR intolerance that made me light a few fires of my own.
if they had come here and expressed their opinions like you have here open for
civil debate, there would have been just that from me, a CIVIL debate. instead,
i and others either got personal attacks or, at minimum, a lot of finger
pointing and inuendos which resembled personal attacks. example; " only a shit
head would do such 'n such", knowing full well the guy that they were
addressing was doing said activities. if you try to push a mule, you usually
get kicked, which is just what they got. if they tried to lead that mule, they
may not have gotten anywhere but at least they wouldn't have gotten kicked.

>many hams come into the
>newsgroup to post responses to such inflammatory threads like "Hams Suck",
>"Ham
>vs CB", and "Why I Am Not A Ham". Inevitably, these kind of threads
>degenerate
>into petty squabbling, name-calling, threats, and counter-threats.

i too have responded to these posts but i think you know that none of these
have originated from me.
as a "warrior" in the battles here, i knew when i got into it that i was going
to take some hits too. i know i'm not bullet proof.
i respect the hams right to shoot back when shot at just as i reserve the right
to shoot back too. it wasn't the cb'ers that started the shooting.

> I think
>it's unfair to tag people (hams or otherwise) who get sucked into these dumb
>flame wars as elitist, intolerant, inflexable "rf police wannabees

the difference between a ham who doesn't agree with "illegal" cb ops and a ham
rf police wannabe is the disagreeable ham will express his opinion in a neutral
style and debate the issues on their merits without resorting to personal
attacks or intentionally misleading information.

>Your point that 27 MHz should be of no concern to hams is well taken

not altogether true either. i have to admit the "legal 40" can be a concern to hams as they have the right to use them too.
i also have to admit that, in the past, i strayed into the rediculeus about hams having no rights to cb but it was more to get a point across than to deny their right to be there.
the point, at the time, was that if ham was as high and mighty and cb was as low and sewer-like as they were comming across, why wern't they there where the "air is clean" instead of down here in the stench with us. it was like they were excercising their right to be on cb just so they could bitch about us. if it wern't for us, they would ignore cb compleatly.
for the matter of the out-bands, if they were the rule abiding citizens that they purport to be, they wouldn't be on the out-bands to begin with and should not have any concern for us being there assuming that we didn't stray into 10 meters. but they were bitching about that too, again, just for the sake of bitching even though those frequencys didn't concern them at all.

>But the
>sad fact is that CBers don't live in a vacuum. Unfortunately, what happens
>on
>CB reflects on ham radio, as the two often are confused in the public eye.

unfortunately, this is not our fault. we don't have a national orginization working for us that could maybe start an educational campaign to show the public that there are differences between the two services.

>IMO, everyone has a legitimate right to disagree with people who encourage
>splatterbox amps or any other practices that give all "radio hobbyists" a bad
>name, whether it's in this newsgroup or any other.
>
this is VERY true. in my opinion, those rights start hitting a rocky road when the insults, personal attacks, inuendos and intentional mis-information flood gates open up.
in the past, i had been attacked as the bad guy when the fact was that i wouldn't lay down and take a whuppin' from the rf police for returning an attack to them in kind for the ones that they threw at me.
there were times during that war that i had neutral debates with other hams who disagreed with my views and the posts back and forth were civil because they didn't immediatly go on the offensive or try to blind side me. they came up to me eye to eye and said i think your wrong because ...
this made it a lot easier to communicate without gunfire. we still don't agree but at least we parted ways with all of our blood, pride and self respect intact.

you and i have crossed flame throwers a lot in the past and probably still don't agree on the basic premise of this discusion but i have to admit, i have enjoyed this debate more than all of the rock throwing that took place between us in the past for which i thank you.
have a good night.

>The existence of a daily updated FCC internet database
>pretty much allows any existing, newly licensed or
>newly upgraded ham be to positively ID'd within minutes

my point exactly. if hams used their names and addresses, they would be id'd immediatly.
back in the days of smokey and the bandit, the mind set was different as most of the handle users probably didn't have a license in the first place. it was a game back then that injected a certain amount of mystery into the mix.
there were also those who made some enemies who couldn't afford to give away their identity for their own safety.
i'm sure there are a few ham agrivators out there who won't id for fear reprisal from there victims or the fcc and a few with big chests who do as a dare to "come and get me" so yes i have to agree, it must be the mind set.

1002. Re: Riley's Influence?

Newsgroup: rec.radio.cb
Date: 1999-11-07 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19991107034259.07146.00003063@ng-cg1.aol.com>
Source record: 9356

>Well, there are a few different ways of looking at it. It's plainly
>obvious, what the main market is for "export" style "10 meter radios".
>If these radios were made more like the HR-2600, with useful ham
>features, but useless for Cbers, then the rig would not be a target (It
>would also not be very popular with the CB crowd either)

i fully agree. what i was getting at is the way the rules are written in their present form and the narrow way the laws on discrimination are interpreted, this minute, these fcc actions could be easily be sucessfully challenged in court.

>Icom, Kenwood
>and Yaesu radios, on the other hand, are not in high demand by Cbers,
>simply because they are expensive, and have features that are wasted for
>the typical "good buddy". The ham market for "real" HF rigs is strong on
>its own, so they need not fear any repercussions in sales due to any new
>technical regulations.

as i said before, the rules, in their present form, could be used to force the icoms and yaesus into change with a me too, black and white arguement in court. all that needs to be said is, "the big boys can do it, why can't i?" end of arguement.
with the high awareness of discrimination and anti-trust monopolies, this would be an open and shut case in favor of galaxy against the big players in this game unless the fcc changes, as you say, it's tech specs.

>This is also a marketing game. The manufacturers of these "export" type
>radios know full well where their main cashflow comes from. They aren't
>selling to hams. So they try to accomodate the features that facilitate
>easy CB operation. They walk a fine, thinly veiled line, when they call
>their products "10 meter ham rigs", but have 40 channel dials, roger
>beeps, echos

this is also very true but all they would have to argue, assuming that the radios meet spectral pureity standards, is production line economy.
the radios, out of the box, transmit on legal ham bands for use by licensed hams. the non-functional "options" are cheaper to install and run on one production line than having to re-tool and run a different style of radio just for U.S. use only and having a small crew to make those "options" operational for the export market.
it's actually cheaper, labor cost wise, to put in parts that, bought in bulk for pennies, and make them non-functional than to stop change things around and restart a production line again. time is money.
this is why when you look in several different models of the same brands of radio, the boards are identical. it's just a matter of wether that model had the optional swr meter, anl / nb or other options.

a prime example was the old PLL02A cybernet boards. a lot of them had all of the parts for the anl / nb but wern't connected in some because they were going into a cheaper box. if you knew the circuitry, you could buy a cheap model and, with a couple cheap switches, have a top of the line model.
actually, it's easier to modify a yaesu 747 than it is most exports. just flip a switch and you're on the road in seconds. how does yaesu justify this?

>a band switch
>that is obviously meant for something, but is not fully functional out
>of box.

you, i and the judge know this but you would have to prove intent which, for lack of a paper trail or a conspiracy, could easily be denied.

>The FCC will most likely amend the rules as they did when they toughened
>the rules for HF amplifiers. They will spell out specific rules, and
>conditions that must be met in order to be sold as "10 meter ham radios"

this is their only recourse but, then again, how hard would it be to put in an 80 channel channel switch and cut in half the number of positions in the band switch?

The FCC will eventually win the
>battle of rulemaking. Any company then trying to market "export only"
>radios will have to play the contraband game if they want to sneak them
>into the US. Many will succeed, some will fail, and may be slammed big
>time. Time will tell..... The government can't stop illegal drugs, so
>if the CB market is big enough to justify the risk, people will still
>sell illegal radios, but they will become more scarce, and more
>expensive as a result.
>

this is what it's going to have to come to if it comes up in front of a truely justice is blind judge. if not, i'm sure they will keep looking untill they find one.
jeff

if they can make dedicated chips for scanners which internally lock out cell freqs, they can do it for 11 meters for ham radios. they would be able to do the same mars / cap mods and the chip would automatically skip over cb.

Source record: 9361

2.5 watts is the amount of power that a TRC 236 is supposed to put out on high power. A 4 watt capable handheld will only put out a full 4 watts when used with a 12 volt power supply.

>CB is *MY* band as well. The fact that I also hold an amateur license is
>irrelevant to these discussions. When I speak about the CB band it is as
>a CBer. I and many like minded CBERS, are sick and tired of those who
>hold the rights of others in contempt, plain and simple.

this is very true. the point here is more symbolic than literal and i'm sure
that i didn't make my position as clear as i could have.
my point is the "rf police" types have come in here with an air of percieved
authority as though they have the right to shove their views down everyones
throat rather than airing their complaints in an open forum for public debate.
i'm not the one deflecting the arguement into a cb vs ham thing. those lines
were drawn long ago by the hams.
the general impression that comes across here a lot of times is that the "rf
police" types believe that they were issued a badge with their ticket and can
patrol the entire radio spectrum.
the hams keep pushing the line that if you want to shoot skip and run power,
get your ticket.
it seems that if there were no problems on cb, the hams would ignore cb
completly and the only reason that they own a cb is it gives them a license to
bitch about us.
if ham is the pie in the sky that they purport it to be, why do you even bother
with something as rinky dink as cb when you have hundreds of megahertz of
spectrum assigned to you that goes mostly unused?
in the case of the out-bands, if the hams arn't suposed to go there and
assuming that we don't stray into 10 meters, our activities there shouldn't
concern you at all.
i never seriously denied a hams right to be on cb but if you hold this band in
such contempt, why do you even bother with it anyway???
with all of the purported benefits of ham, cb must look like the old 100mw toy
walkie / talkies of days gone by.

This is not the case.
>It's is more a "clean, decent, law abiding, respectful vs. selfish,
>arrogant, scofflaw".

the "rf police" always come back to the "scofflaw" arguement. they always pull
this one out of the hat wether they are into cb or not, again, just for the
sake of having something to bitch about.
if you see someone on the street beating someone with a baseball bat, by all
means jump in and stop it. with all the bitching that the "rf police do here,
it's akin to turning in everyone who drops a gum wrapper or j-walks across a
deserted country road at 12:00 am. but doing it with much vigor.

>Like it or not, there will be times in your life where you will have to
>deal with people who DO have authority over you. You have a choice, to

>guy, who was trying to contact his base after work. One day the guy said
>to us "keep it up, sooner or later you'll all have to see me, and then
>we'll talk". We laughed at him, at his "idle" threat.
>
>But we soon found out what he meant. Seems that this guy was the chief
>examiner at the drivers license center. He took the time to find out who
>most of us were (It didn't take much considering all the clues we gave
>out in our conversations), and when it was time to take the driver's
>test, it was payback time. Many of our group had to retest several times
>(I had to test 3 times).
>
>So just remember, what goes around, comes around.......
>
interesting story but assuming that you and your friends demonstrated the skills to pass your driving tests on the first try, this was a clear case of abuse of power by a public official for which there should have been a complaint filed and he should have been fired on the spot as his actions were driven by a personal grudge and not an official function of his job.
what if he made a lot of broad assumptions about who was causing him problems and some innocent kids were unfairly failed just because he assumed they were involved in your actions?
you and your friends shouldn't have layed down and allowed your selves to be steam rolled this way just as i / we won't lay down and be steam rolled by a bunch of high horse riding, holier than thou, hams who think they have a license to control other people.
your authority over illegal radio operations is restricted to the same procedures as any other citizen who has an interference problem.
you have the right to inform the fcc of your concerns and assist them in any way that you choose. THAT IS ALL.
now on the other hand, if you were to approach me / us and get off your high horse and look me in the eye, man to man and express your opinions, we could discuss them on a level playing field.
you may not change my mind but you would garner a hell of a lot more respect from me for your views.
comming here and slamming things down peoples throats only causes sudden deafness and accomplishes nothing.
have a good night.
jeff

> I have been into CBing for
>25+ years. One thing I could NEVER understand, is why a person would go out
>and buy a "big' radio, and a "big" linear and then ONLY use it on channel 6
>(27.025) A friend of mine ran a Yaesu FT-101EE into a Yaesu FB-2100 amp
>SOLELY on channel 6.

Its a National call channel except you don't have to leave. It also is the local channel all over the US when DX is not present. I've often discribed channel 6 as the backbone of a highly competitive and ego driven hobby.

>And I've heard about the 70,000 watt 'SUPERBOWL'
>mobiles. But WHY??? What's up with a "Shoot-out."

Although its done from time to time it is not the norm to see 70k from a mobile on the bowl. These are more frequent at the Shoot-outs. Shoot-outs are contests plain and simple. Whomever can be heard and understood on the tape is the winner.

>A person COULD run only
>100 watts on a sideband frequency of 27.355-27.405 and work THE WORLD !!!
>(providing of course, it was legal.) So... BIG radios or not, Europe is
>just a 'key-up' away... on sideband.

This is true. I once was dialing-in a new antenna system on my mobile and asked these two men where they were. They said 40 and 50 kilometers south of Buckingham Palace. The barefoot radio wasn't even doing 12 watts pep.

>And if you are ONLY running ONE channel
>(ch. 6) go to Radio Shack and get a ONE-CHANNEL radio. Surely it MUST be
>cheaper than a new 2990. FLAME ON !!

I wouldn't know. I don't shop there. I use the electrical supply houses in my area.

Hello Phil: I called Marv, nice and friendly guy to talk to. He told me the tower had to be lowered, to be removed. And said the tower could be easily lowered and loaded on to a trailer.

But Ipo Mr. 137 had nerve enough to call me and ask if he could have it. I told him to go for it, but whenever he gets rid of it I am first on the list. I have to many irons in the fire now, to run down to LA and get the tower. This way the tower will be picked up in time (Ipo being a menace to the general good of all, will pick up the tower, post haste) and I won't have to break off from all the how-raw that I am into.

I tried to e-mail Ipo three times, but after I removed the "nospam" it didn't come back. So I think it got through.

The Penetrator 500 antenna update. Right now I am working on expanding the usable band width of the 5/8 ground plane antenna. Ok now I remember, the updates where installing eye-bolts in the ground radial bracket, to allow none metallic guy wires to be attached, resulting in a much lower mechanical stress being placed on the top mast. I know how windy it can be in Jolly old England, I believe that the fierce winds there would whistle as they passed between my ears.

IPO did you get my e-mail?

I have a dusk to Dawn light mounted on my tower about 15 feet below a 6 element beam. I am wondering if the 250 watts could make the bulb go bad. The light is the mercury vapor type and I had to replace the bulb after 8 weeks of it being mounted??? any ideas???
Thanks Jim<><

Low paying jobs may be the only jobs left one day. And you won't get
any disagreement out of me when it comes to companies moving overseas.
Lets not forget the effects of massive immigration. Too bad those in DC
cannot see all that, just don't care enough to see, or see and don't care.

I never said that the FCC has control over him. I just said that the
FCC is having an effect on Radio Shack's products. And, if I remember
correctly, using a linear would also be illegal over there. Therefore,
the rest of you message simply does not apply, or is inaccurate.

Furthermore, I don't see what your complaint is about. I felt that I
answered his question honestly and openly. Perhaps you disagree with
the fact that I mentioned that using a linear is illegal, but that was honest.

Where did you find this information about the Coast Guard? I was
under the impression that all USCG group operations centers had radio
facilities with HF capability. The same with district-level emergency
command centers. And the same with the larger vessels.

> reports.

Not according to the articles I've read. For example, Popular Communications (Nov) stated that the FCC was responding to complaints from amateur radio operators in the area and that the amateur radio operators supplied audiotapes, with the results of RDF and close-in monitoring, as evidence.

The article stated that FCC agents traveled to the area and observed Floppo's communications on the CB band, not on the Ham bands. However, the FCC decided to issue a warning notice anyway based on the evidence they had.

It further stated that an FCC agent returned to the area to investigate renewed complaints, and the agent "used direction-finding techniques" to determine that Flippo's residence was the source.

The agent then, with the assistance of the Palm Beach Sheriff's Department, attempted to inspect Flippo's radio station. Flippo refused to allow the inspection and a "Notice of Apparent Liability for Forfeiture" was issued a few days later.

You can read the article yourself. Its in the November issue of Popular Communications Magazine (page 66/67), available at most bookstores.

So you're saying that all those reports of unlicensed operators being "busted" are totally false? All the various publications are lying and just making up the stories?

If you think Hollingsworth is such a joke, why don't you write to him with your comments? And use your real name when you write - you hide behind your handle and spout things that you would not have the guts to say if your identity was known. And please make sure to tell him about your "World Wide DX" activities while you're at it?

I'm not a huge fan of Hollingsworth either, and I've even criticized him in the past for some of the statements he has made concerning free speech (using my real name). But I have no complaints about the enforcement actions he has taken so far, especially when it comes to unlicensed operators.

Everything is a pretty broad spectrum. List the items you want your base station to do. Then we can probably give you some insight.

The 10 meter radio that you are talking about does a lot. But it can also carry a hefty price tag.

Good luck in your search.

You should only use the minimum power necessary. 200 peak watts is plenty. Most amateurs on 10 meters only use 100 or so. If everyone kept the power down I wouldn't have to hear such things as "this is the CB Shop, exit 108 what do you need?" He's in Oklahoma, I'm in NEW YORK!!!! This guy is on 23 all day long running more than 200 watts!!!! Oh and don't forget the ebonics boys on 6 and the deliverance buddies on 26.

I just bought one myself thinking it was as good as my TRC-485. Nothing inside these two radios are the same, not even the LCD display!!! The Sidewinders S meter goes from 5 to 9, NO 7. The Korean made Radio Shack is much "cleaner" inside with high quality workmanship while the Philippine made Sidewinder looks as if it was thrown together with spare parts. Theres mounds of solder on the chassis grounds as well as file marks and the powercord is held in the radio with a big glob of glue. The Sidewinders performance isn't up to par with the TRC-485 either. The receiver sucks, the noise blanker isn't as effective as the 485's, and the audio isn't as punchy. The Eagle is crap and will be auctioned off. Thats just my opinion on the Sidewinder. I may be wrong.....

There's your problem son, as well as some of those
guys that just don't seem to understand that an "electrical
ground" and an "RF ground" are two totally different things.
Just how much "PROPER" RF grounding can you really
expect to get in a car or truck anyway at 26 to 28 Mhz?

And just in case you really want to know, you can put as
many GROUND RODS in the earth as you want and you
still have not addressed the problem of having a poor
RF ground.

When I used to help out some of the local trash spewers,
OVER HALF of them were cured with a good RF ground
in their frequency spectrum. The other stuff was poor
coax connections, no isolation from house wiring, ground
loops by the ton. And on & on & on.

Now that the TV & phone makers have stopped adding good
front end protection on their products in order to get the
prices down, it has left it wide open for stations like I
described above. And when it gets to the point of you
"CBers" versus "the kids or family watching TV or using the
phone" who do you really think is going to be the winner
in the long run. You can spit out that rubbish about "they
can't do this or they can't do that" but you are only fooling
yourself there fella.

Oh by the way sonny, when old Riley or one of his boys
come knocking at you door, you can beat your bottom
dollar it won't be for anything you have typed in this
newsgroup. But like any other good enforcement officer,
they are always open to reports of illegal activity so
they know where to start building a case.

And soon as a few high profile cases hit the news
papers. all those neighbors that have had to endure
RF splatter will be calling in just for you and people
like you. Just like a 911 call, soon as someone reports
you, that's all they need to enter the QTH and have a look.

If you are legal and have good RF grounding, not to worry.
If not, then better start hoping the judge hasn't had any
experience with CB splatter at home. Oh yeaaaaa

Just a few tips in case you really want the low down.

Blah blah blah, more ham radio trash.
(snipped & deleted)

CB Florida Quarterly did their own researh
on the Flippo bust. They found the FCC news
release, which the article you quote from, was
base on, was full on half-truths, exaggerations,
and outright lies. Flippo teed off a couple of
you stupid arrogant hams because he had a
stronger signal & worked more DX, so the Hambos
decided to get even and begged the FCC to
get Flippo.

Hambos SUCK, CB rules.

Hi Steve:

I was looking at these the other day on bills2way -- nice looking radios. However, I too was curious as to their performance, especially since they are so new.

Any info or details you can share from you tests. I don't see anything about these listed on your website.

Thanx,
Jay

Wow, if this is true it throws this self-policing thing out the window! If ARS operators don't respect Hollingsworth, their own rules and the oath that they took why should the average CBer?

Not one, REPEAT, not one single unlicensed station has been prosecuted by Happy Hollingsworth, bullshit artist extraordinary.

Any doubts? Tune into 14313 kHz or 3950 kHz. Jamming, name calling, swearing, all coming from unidentified stations, and Hollingsworth has yet to catch even ONE!

All Hollingsworth has REALLY done is go after a few IDENTIFIED high-profile hams, who were using call signs. He made examples of them, and the rest of his big enforcement campaign is bullshit and lies.

More facts: ALL FCC monitoring stations were closed in 1996. There are no more FCC monitoring stations. The so called automated monitoring network is a total failure. It never works, and Congress has refused to give the FCC any more funding for this failed project.

Hollingsworth junkets from hamfest to hamfest, squandering the tax payers' money and feeding BULLSHIT to ham operators who eat up the bullshit like babies eat candy.

My experience with those types of lights is that they will blow under
just about any circumstance. Your better off replacing the light with
a regular fixture that takes a couple of halogen par flood bulbs.
They make long life ones that will literally last for years.

Hollingsworth is an enforcement consultant, not a prosecutor. However,
this is not to say that the FCC does not proceed against unlicensed
stations. The web page at
http://www.fcc.gov/cib/News_Releases/Welcome.html
lists numerous releases from the FCC's Compliance and Information
Bureau detailing actions against unlicensed stations.

I think that William Flippo, the freebander in Jupiter, Florida who
got socked with a $20,000 fine for unlicensed operation and other
violations, might tend to disagree. :-)

>More facts: ALL FCC monitoring stations were
>closed in 1996. There are no more FCC
>monitoring stations.

FCC maintains the same compliment of monitoring stations, however
instead of each being individually staffed, they are now remoted from
the Virginia station, and/or from the Washington, D.C. operations
center. The Coast Guard has done the same thing with its
communications stations, there is only one CommSta left on HF, that
being CommSta Kodiak in Alaska. The rest of them are now remoted from
either CAMSLANT or CAMSPAC. This is done to make more efficient use of
available personnel. The Air Force is currently doing the same with
its GHFS system, which will soon become the Scope Command system.

I'm not sure if you're just creating a CD full of user manuals for
people that buy military surplus communications equipment, or if
you're creating a CD that might be of interest to military
communications monitoring enthusiasts as well. If the latter is the
case, then how about the military's own field manuals that specify the
doctrine under which military personnel operate this equipment?

For examples, here are some military field manuals to look at:

FM 24-11 (Tactical Satellite Communications)
FM 24-12 (Communications In A "Come-As-You-Are" War)
FM 24-18 (Tactical Single-Channel Radio Communications Techniques)
FM 24-19 (Radio Operators Handbook)
FM 24-33 (Communications Techniques: Electronic Counter-Measures)
FM 34-40-7 (Communications Jamming Handbook)

There are others out there as well...if you look around on the WWW
you'll find that you can even download all of the above for free, from
one place or another. This fact may not please some people who are in
the business of military communications security (COMMSEC), but it is
a fact nevertheless that such information is widely available.

From the reports on the FCC website, it looks as if Hollingsworth is doing his job and doing it well. That is, he is busting the illegal FM transmitters that operate in the FM broadcast band. The people who do this are warned several times to cease, and each time they ignore the FCC requests.

I really wish that people who do run really high power on 11-meters would please consider what they are doing and how it may do to hurt the hobby they most obviously love.

Well, first of all, congratulations, Mr. Chairman, and good luck to
your new organization. Now, as to the duties of a club president, this
is something that is usually spelled out in a club's by-laws, Dennis,
so I assume your group is so new that your founding members haven't
agreed on by-laws yet.

I've never been a club president, but I did serve as Vice President of
a computer users' group for a couple of years, so I can offer a few
insights into the operations of a club and the usual duties of its
various officers.

One duty of a club's president is to preside over club meetings. (If
you want to discourage members from attending meetings, watch the
President Pro Tempore of the United States Senate on C-SPAN for an
example of how NOT to preside over a meeting, HIHI). That applies to
officers' meetings (executive board or whatever you choose to call it)
as well as meetings of the general membership. Most clubs adopt some
form of rules of protocol to govern how meetings are supposed to be
conducted - often using something such as Roberts Rules Of Order, or
other form of parliamentary procedure to accomplish this. The
president then conducts meetings in accordance with that protocol. In
larger groups, another officer (Sergeant At Arms) is often created to
assist with this task.

As a radio club, you may wish to have an on-the-air net instead of or
in addition to regular meetings - especially if the membership is
geographically separated so as to make meetings problematic. In such a
case, your group may wish to specify that the President serve as Net
Control Station in lieu of presiding over the kind of meeting where
everybody gets together in a public place.

In one club that I belonged to, another duty of the President was to
perform a quarterly check-up on the club's financial standing. This is
normally the regular job of the Treasurer but the club I belonged to
was worried about the possibility of the Treasurer screwing up, so
they made it the duty of the Prez to check up on him once in awhile.

A club president also serves as a spokesperson for a group. Should your club ever find itself in a situation where people want an official comment on something from the group, the president is usually the person they seek out to obtain such a comment from.

If your club has a newsletter, it's usually a good idea for you as president to write something for each newsletter, too. And, of course, once your club does agree on and adopt by-laws, or a charter or whatever you end up calling it, part of the duties of the president (and indeed of all other club officers as well) is to make sure that all of your group's activities conform to those by-laws.

Other than that...you usually have a Vice President whose duty is to assist the President in the above, fill in for the President when the president is unable to discharge the duties of his office, and usually is responsible also for the "program" of a meeting (arranging for special demonstrations, guest speakers, etc.). Also a Secretary/Treasurer to take care of correspondence, finances, and recording minutes of meetings - some larger groups will have a separate Secretary and Treasurer positions...or even a Recording Secretary and Corresponding Secretary in addition to a Treasurer. Your group will have to decide that based on your own needs as a club, but I'd advise you to make sure you have someone whose job it is to maintain good relations with other clubs, local authorities, the press, etc.

Finally...once you begin operations you will generally find your group may be creating various committees to deal with special situations and events that your club is involved with. For example, if your group offers refreshments during meetings, you generally have a Refreshment Committee that takes care of that. In most clubs, the President is considered an "ex officio" member of all standing committees. (The term "ex officio" is from Latin meaning "by [virtue of] his office") That doesn't mean you have to involve yourself deeply in the activities of the Refreshment Committee...but it may mean you might be called upon by that committee to provide guidance and thus you should be prepared to do so if called upon.

Other than the above...just do whatever you can to advance the good standing of your group in your community and to further its causes, and always bear in mind that whatever you do as president of your group will reflect on the public image of the entire group.

73 and good DX'ing,
John D. Kasupski

Best Buy and Circuit City DON'T sell Dave Made! you dummy

Your reference to Circuit City, Best Buy, etc., makes no sense to this matter.
If you can't supply your customers with a product because the mfr. takes 4-8
weeks or more to get it to you, why bother carrying the product? If you have
that much trouble getting the new product, imagine trying to deal with
warranty.
It's not just the dealer that needs to provide customer service, but the mfr.
to the dealer too.

24 years ago, i had a stock 23 ch cb.
the model name was a marlin but i can't remember the off-brand maker.
in the subdivision where i used to live, before cable, the deed restrictions
dis-allowed ANY kind of outside antennas but they did provide a master antenna
at the club house that, for a one time fee of $20.00, you could hook in and get
the 4 local channels.
if i parked my mobile at the club house and keyed up on channels 1 through 12,
no one there watched tv untill i un-keyed.
stock mic and radio, no amp, trunk mount antenna.
wiped out 4 tv channels. front end overload into their distribution amps.
few people pissed me off back then. :):):)

I have seen this problem when power is applied to the unit. It doesn't have much protection in the power circuit so that when operators connect the radio to a power supply or car battery, via lighter socket or wire, it gets a spike of voltage and goes blank. Something that worked for me, is to disconnect the radio, then turn on the power switch to drain the circuit, and then turn it back off and connct to the power source. Other than that, I suppose that you could build a little diode circuit to keep the spike away from the radio.

If this is true, then self-policing is a complete failure. ARS has relatively few operators. This makes me wonder why they can't control the "handful" of illegal operators in their ranks. Surely, from what I've read in this newsgroup, this can be accomplished in a few days. Just call Mr.. Hollingsworth, right? It has become apparent to me that he is unable to carry this mission. I can find and record a CBer in my town in less than an hour without $30,000 worth of truck and equipment, hundreds of employees, a multi-million dollar budget and thousands of RF police. Why can't they do something about a licensed operator?

I've been on the radio long enough to know that you can't reason with a jammer or fool. It only makes it worst to acknowledge a person. By doing so you've only validated their existence. They now have a purpose and a victim. Anyway, I'm just trying to help some of you guys, and you know who you are, because crying isn't working either.

Not one, REPEAT, not one single unlicensed station has been prosecuted by Happy Hollingsworth, bullshit artist extraordinary.

Any doubts? Tune into 14313 kHz or 3950 kHz. Jamming, name calling, swearing, all coming from unidentified stations, and Hollingsworth has yet to catch even ONE!

All Hollingsworth has REALLY done is go after a few IDENTIFIED high-profile hams, who were using call signs. He made examples of them, and the rest of his big enforcement campaign is bullshit and lies.

More facts: ALL FCC monitoring stations were closed in 1996. There are no more FCC monitoring stations. The so called automated monitoring network is a total failure. It never works, and Congress has refused to give the FCC any more funding for this failed project.

Hollingsworth junkets from hamfest to hamfest, squandering the tax payers' money and feeding BULLSHIT to ham operators who eat up the bullshit like babies eat candy.

The rubber ducky antennas are probably the problem. They can also be referred to as "air cooled dummy loads" since they work about as well. Get a pair of inexpensive mag mount 5/8th wave antennas with barrel connector adapters for the radios and that should help get you the mile or so you are looking for.

Regards,

Arnie -

I've got a newbie question hat I haven't seen covered anywhere:

Most linears I've seen info about talk about a 4W input, which makes
sense
but SSB units put out 12W. Do I have to pad the output of my radio down
to use it with a linear or will it take the 12W SSB just fine?

Thanks,
Chris
SSB: SE Mi 909, 38 lsb

Dear Sir, im a 40 yr old male and a 25 yr old veteran in this hobby of C.B. radios and scanners and i must say that for the first timer id buy something nice and reliable. Probably a old vintage rig, like a Tram, or an old Browning, these radios are very plentyfull even though their 25yrs old some of them, and ones in good to excellent condition are not too rare to find.Personally ive just bought a Tram-D201-A 40 Channel/with SSB (single side band) for 400.00 dollars but im quite sure this rig will last me the rest of my life, and its VERY reliable and sturdy, VERY loud in audio levels and its pretty to look at, so i wish you luck in your endeavor but its just one opinion, and its mine. Take Care, Best Whishes.... Frank at jj475171@aol.com

The bad thing about the par floods is that they do not give off enough light
for the amount of energy used, if you use a good dusk to dawn fixture and
not one of the $20 unit it will last a lot of years, the cheaper units have
a crappy ballast in them and the lamps are also the cheapest they could
find, the amplifier should not affect the light fixture.

>antenna.
>

I understand that many countries don't share our CB band. And I do understand that most DX stations don't speak English on CB, but what about the ones that do? Huh? If they CQ for my call, what, do I just ignore them? I don't have a "pin-point" signal tracking system that tells me whether or not they are local. Every DXers signal I recieve here in this illustrious "bowl" around my parts is 20 over 9 (AM or SSB). And if they identify their QTH (and call) and their location, what do I do then? I've already gave them a QSL.

Besides, 137's 5-element beam antenna that he made for me works excellent. Don't need a better antenna. I'm still trying to get his 5/8's wave verticle from him.

> Hell, some people might not want to go to 10 meter
>> and work DX's. Some might just want to stay 11 meters.
>

Breaking the rules is not my priority on the DX agenda. My interests are the ability to communicate, PERIOD. And I don't want to become an "elite" by taking a test. I know the rules. And thats all I need.

I think Andy just don't want any CBers to have one,RF limited would
never offer a 10 meter rig that couldn't be converted,I'm just suprised
it doesn't have an echo and transvestite board.

you guys have a lot of nerve, to pick on this gentleman. Although I've never met this person, being a registered monitor station, was very popular back in the '60s and '70s, it was sponsored by the same people who publish CQ for S 9 magazine, not sure which one. Many hams, started listening to short-wave, public service frequencies, before it developed into a interest in amateur radio.
Not everybody who enjoys listening to short-wave or public safety wants to be a ham. Just like some hams don't listen to short-wave broadcasters for public service agencies.
I doubt, that there's any harm in being or continuing to use the registration call signs issued by the magazine. What you care as long as he's not broadcasting on amateur radio frequencies for public service frequencies. this is America, if this is how this person enjoys his pursuit of happiness, let him, without insulting for making fun because his hobby is not your hobby.if you need someone to pick on in the radio hobby, go to 80 meters at night and listened to some of the so-called professional radio operators going at it. Let the man in joy his hobby.
enjoying your operations center , forget the ones who make fun of something they do not understand.

> to use it with a linear or will it take the 12W SSB just fine?

AM and SSB power are measured differently. AM power is
measured using average wattage, and SSB power is measured
using peak wattage. The mathmatic relationship is average
times four equals peak (under normal conditions). The
reverse applies as well: peak divided by four equals average.

So, when an amp says it's rated input power is 1 to 5 watts,
that means the amp can comfortably handle 20 peak (SSB) watts.

As for padding the unit down; that's what the power level
switch does.

I have turned the radio on to make sure it works, but since it is not converted, and i am a not a licensed Ham, it has'nt really been tested right yet. I did find a modification that is different from the others that are well known, so i am assuming it is the new version. If, i can find the circuits on the board where they should be, i will give it a shot.

As far as Coppers is concerned, my orders over the last 2 years with them have all went well. I have not had the problems that others have had with them, and i have bought over $1400 worth of radios and other items. So, i have no valid reasons to not do business with them. If, down the road i start having the problems with them that others have had, i will stop dealling with them. But until then, whenever i need a radio item, i will probably buy it from them. Best Regards

BULLSHIT? Whaddaya what? Are you agreeing or are you disagreeing with me?

The statement was simply asking what about the stations that do speak
English.

And no. Never assume that "people in far away places can speak english just
like the hams can...". If they could speak English (the local talkers), and
you try to contact them, of course they won't call back to you because
you're a "mudduck"! Just because you can hear them doesn't mean they can
hear you...

Have you ever tried talking to Mexico when the Mexican skips are in
(everyday)?

First off, let me state that this post is of my own personal opinion and is no way connected or endorsed by Sporadic Waves. I am a monthly contributor to the Magazine, The editor/publisher graciously allows me a column each month. I also write for several other publications. The groups of people I have met and QSO'd with through the magazine are terrific. No one advocates the interruptions of any others transmissions or intentional jamming, no matter WHAT some others may post. I am a freebander. It is what I do. It is what I write about. Spare me the flames of my responsibilities to radio and upholding the law. I have been doing what I do since the early 70,s and that is what I write about. It is my choice and I willingly accept the consequences should the time arise. I do not splatter the spectrum with a gazillion watts nor am I rude on the air. I talk all over the world between 25 and 28 megs. and usually with no more than 12 whiskey out on the side. My reason is simple. I have no interest in a repeater rebroadcasting my signal. I achieve the same results as the "big hams" at a fraction of the cost. I know many fine hams and I respect what they do. My choice is my own. I do not interfere with other operators and my QSO's are usually limited to a quick exchange, long enough to exchange cards. The fact that a magazine can raise your ire by containing stories and modifications not endorsed by our Uncle Sam is absolutely fantastic. That is what makes America great. One may not agree with what one reads or hears, but that does not mean the others view point should be censored or condemned. It is all about knowledge and I can not emphasize that point strongly enough. When you begin slinging innuendo that is unfounded and unproven about a group simply because of its vehicle of media, your own credibility becomes instantly compromised. There are volumes of publications that are of questionable content available. Laws abound that make many activities legal elsewhere , but illegal here. Does that mean we should not be able to read and learn about these situations? Reading an article by a publication or an author does not automatically mean the content is advocated by such. I don't hold anyone to any set of standards when broadcasting. If you want to act like an idiot, why the hell should I care? There is a channel selector and an off switch. I also espouse the virtues of microbroadcasting. Should that be censored? I am an Independent Radio Station. Please don't judge an entire organization or even an individual based on a few un-informed posts. Do the research yourselves people. Come to your own conclusions.

Just friendly advice.

First, it is for AUCTION. Secondly. Start your subjects for things on auction with

FA:

That way those of us who dont care can filter out these messages..... basically do what you did for the TRC-88 but instead of FS: use FA: go figure what the A stands for.

Hank

If you just got a hold of this (or even if you didn't) may I suggest not butchering this radio up. It is a VERY desirable radio. If you cannot find R131 then please take it to a "tech" for your sake. Dont try to save $40 on a $300.00 radio is what I am saying.

Dont take out TR24. Dont ever take a modulation limiting diode or transistor or at the very least on this radio. Your SSB will sound like crap if you do.

Hank

I would recommend you buy something used, but in good condition. This may be easier said than done as many CBers like to take their radios apart and fiddle with the innards. However, if you're lucky you can find one that hasn't been twiddled.

With this in mind, I would recommend a SSB radio over an AM only. SSB radios are far more versatile and have much greater range than AM. I personally like the President Washington base station. A good used one of these shouldn't set you back more than 100$.

Can someone explain to me how these "division" numbers work when DXing?

Also, what are the letters in between? For example: 14AT123 or 14SD123
I assume that 14 is the division, but what about the letters?

>I understand that many countries don't share our CB band. And I do
>understand that most DX stations don't speak English on CB, but what about
>the ones that do?

this statement is total bullshit. the people in far away places can speak
english just like the hams can. this is just another myth the hams continue to
make the hams seem better. the reason you hear so many different languages is
because the dx is rolling and your hearing people in other countries local
talking between them selfs. most times they could answer but choose not to
since the majority of usa guys are ass holes asking for radio checks and breaks
with echo mics, i dont answer them either.

It should be fine. That said, I had to pad the input to one of my amplifiers even for 4W AM!

It's a pretty old (and cheap) think and I think the better amplifiers now all will take 12W PEP in their stride.

the division number stands for what DXCC country the person your hearing is in.
the letters between the numbers is there club AT(alfa tango group) and SD
(sugar delta group) and there are more, the numbers after the letters are there
unit number in the group. now the three biggest groups are AT, SD, and IR.
you have to join one of these groups to have a number like you are talking
about but others just choose to make them up on there own. see here for the
division list http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm if you
would like to know more about a few really good groups follow the links in my

Competition? But wait a minute. If the typical super-modulated 5000 watt signal on 27.025 tears up 4 or 5 channels on either side of it, then it's really as if you are playing your car stereo loud enough to be heard a mile away, or racing your big V8 in a school zone, or building your big house partly on a neighbors property, or stocking every store in the shopping mall with nothing but beanie babies. Kind of inconsiderate, wouldn't you say? It's like forcing those who don't want to play your game to play it - whether they want to or not.

I've got nothing against competition. You know, NASCAR was started when 1920's bootleggers started getting together on weekends to race the souped up sedans they built to outrun the Feds during the week. These guys did the right thing and took the racing off the street and onto a closed track where it wouldn't bother other people.

Too bad you fellas can't get a little part of the spectrum set aside for legalized high power mobile competition. Like say up in the VHF/UHF range (where the effects on those who don't want to play would be minimized). I'd imagine there would have to be SOME limits and SOME regulations to insure that other UHF/VHF services were not effected. There might even be a license of some sort, maybe a qualifying test. But I'm sure that anyone who could put together one of these mobiles could easily pass that kind of test.

Of course the present-day FCC would blow a gasket at such a proposal. However, if "the Bowl" and its ilk were to remain a steady fixture on the CB scene, then perhaps a few years down the line such a proposal might not be such a radical idea anymore.

Now maybe I've got it all wrong and the SuperBowlers don't want to be sanctioned and have a place of their own to play. If so, then their "sport" is really more about selfishness and immaturity than sportsmanlike competition.

Greetings!

Thanks tnom...

That radio was a bear!

Grizzly one at that!

The easiest fix was to Take T1 off on the MB3756, cutting the trace,
and run the Regulator straight to the power switch thru the jumper
that was removed on these radios, that still had the foil traces from
their predecessor the Uniden made 148 GTL and the Grant XL. Go figure?

The rest of the mess dealt with a 10 ohm resistor labled L9 by Pin 9
of the MB3756. Voltage starvation, causing the RCI-MB8719 to never get
a stable regulated voltage to the VCO-loop.

Change that to a ferrite bead, and pretty much brought the radio back
to stability except in worse cases of audio overdrive.

Hope this helps...

Nah, there's something to be said for doing it yourself. Mind you, I wouldn't use a TRC47 as a starting point. That doesn't use the single-chip PLLs and can be a bitch if you trash something in the project. I don't know if you can easily divide down the operating frequency to get you into 10m SSB proper either. I would start with a TRC457 or 458 for this project. Getting it to work in 10m is a piece of cake. Mind you it is beyond the scope of my posting here and now, but if you have a clue I don't mind helpin' out.

I would start with the following....

- determine if you can get at the 10m SSB frequencies with the PLL circuit in the radio.
- if so, you will probably have to modify the VCO as it'll drop out of oscillation up there and will have to be tweaked.
- tune up the Tx. This should come up pretty easy.
- tune up the Rx, this might be a little difficult as the coils are intended for 11m. A little padding may be in order here - but not a lot. .

If this makes sense to you then you should be in good shape. FWIW, I'm told you can take a TRC449 and get it working on 6m, so 10m is doable.

MC 10kW is gone dattaway....

Greetings!

Yes, you've disconnected ALC and AMC.

With that in mind, you are now seeing what the radio can produce flat
out with no other mods.

Now, as far as quality, that is another issue.

While Dancing with the Mouse on 7 Oct 1999 03:45:32 GMT, the Modem
interrupted with an MNI from "rjchen@leland.Stanford.EDU (Robert
Joshua Chen)", and the MotherBoard buffered this to Video RAM:

Greetings!

Easy, easy...

Although theres nothing wrong with expressing opinions...

There is a lot to be said about the radio owners responsiblity.

If the owner is happy with it, then so be it.

But, if the owner doesn't know, and gets into trouble, well - thats
why theres such a big difference of opinion...IMHO.

I stand behind Jack, and support Bills' opinions. A lot of it has to
deal with the "neighborhood" these people reside in.

They run the stuff the next guy has. If it means splatter, or echo, or
fuzzy FM-ing audio, <chuckle> well - we know there are two sides to
each fence.

I was in Bill's Shoes when it came down to nit-picky owners that
wanted AAAUUUDDIIIOOOHHHH but stayed out of the TV. Sigh...some mods
don't work like they're supposed to.

You can't please everyone, so just try to please people you can.

The return customers are the ones that like the work done...

While Dancing with the Mouse on Sun, 10 Oct 1999 01:38:03 -0700, the

<fire228@cybertrails.com>", and the MotherBoard buffered this to Video
RAM:

---8< Snipped as to not be repeated >8-----

Jack, when you have a moment, I've found some mods that can easily be
done to any radio with single line ALC/AMC detection.

I also found some other neat stuff you might be interested in.

1138. Re: Midland 79-290..again

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3826451c.3196006@news.iserv.net>
Source record: 9475

Greetings!

As far as I know, the Midland 79-290 is the *only* AM/SSB radio with
WX reception.

It's a dynamite little receiver, a little loose on rejection, and has
been known to have a noisy ground-plane of a board in it [no power
supply filter for ground loops on the radio like Unidens PC series].

If you are having good results with your current set-up, the Midland
will give you a little more noise, but has those extra features you
want.

How little is little in the noise catagory? Depends on you and your
radio/antenna mounting scheme, and how you want to run the radios
controls for acceptable results. You'll have to ride some controls
more than others, RF-Gain for example, so something to think about.

While Dancing with the Mouse on Thu, 07 Oct 1999 02:03:01 -0400, the
Modem interrupted with an MNI from "skorzy@SPAM_KILLER.mindspring.com
(Dr. Skorzy MacFarlaighn)", and the MotherBoard buffered this to Video

Greetings!

Although clipping the CENTER lead of Q29 is going to work, why not
look at this page for help...

http://www.iserv.net/~codyspc/PC-122XL.htm

The radio you have, is based upon Unidens PB-122 derived chassis.

I've got some mods there that can help you versus having to disconnect
Q29, which although doesn't hurt, it doesn't help much either.

If you're concerned about audio, look at the pages first, then decide.

While Dancing with the Mouse on Sun, 10 Oct 1999 00:24:21 -0400 (EDT),

From what I've seen, many of the "standard" amps (standard as opposed to high drive) perform better and reproduce the audio quality of your radio more faithfully if you keep the dead key from the radio down around 2 or 3 watts and let the radio swing up from there as far as it wants. Examples are various flavor of Palomar 250 amps, Texas Star, etc. Even some of the larger amps such as Messenger 4V's and such work fine with a lower dead key because they have a built in driver section.

For those of you who big boyz that run the bowl, I'm talkin about amps for the normal folks. Ones that under normal usage wont require beefed up alternators and such.

Does anyone have a source of readable schematics for a Cobra 29 LTD classic (circa 1990) and a Uniden Grant XL?

1149. Lincoln or Galaxy/RCI base?

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: rjchen@leland.Stanford.EDU
Message-ID: <8066vhrqr1@nntp.Stanford.EDU>
Source record: 9486

I'm currently trying to make a decision between a Lincoln and a Galaxy/RCI to serve as a 10/11m base station. While the Lincoln, after chipswitching, has some very nice features, the low level AM modulation bothers me a bit. The Galaxy/RCI radios I'm considering are the RCI 2950, Galaxy Saturn, 2517, and the 2527. The only criteria I'm looking for is that the radio is able to be modified to work well on 11 meters, as well as 10 meters, after conversion (I hear the Saturn loses some capability on 10m).

Any suggestions would be greatly appreciated...

Oh, get off your high horse, CB1999. You don't go to the ham radio
newsgroups because you don't have a ham radio license and therefore
nothing there applies to you.

We (myself and the other ham operators here) are all CB operators
also, and therefore anything that is said in this newsgroup does apply
to us also. That is especially true if the discussion relates to ham radio.

The only "sandbagging" that is going on here is coming from you.

Ah, now we are getting somewhere. You finally admit that hams who use
CB equipment have a right to discuss CB related topics in this
newsgroup. And you claim that we have no right to discuss out-of-band
issues because it does not have anything to do with CB or Ham radio.

So, what in the heck are you doing here, Jeff? This newsgroup is for
discussions about CB radio. This newsgroup is called "rec.radio.cb,"
not "rec.radio.freeband" or "rec.radio.out-of-band."

You are the one who does not belong here. By your own admission, your
discussions about "freeband" activities, or "out-of-band" activities,
does not relate to the topic of this newsgroup.

IValentin,

>Can someone explain to me how these "division" numbers work when DXing?
They don't.

Everyone wants to be No 1.

The largest group currently is the Italian based Alfa Tango club where Italy is division 1. However, over the years many international clubs have started with their own country being No 1 thereby confusing the situation for everyone.

In fact I believe the original group was the Earth DX group in Brazil, S. America, where 2 echo was the N. American designated number, many other groups existed way back when, World Wide Radio Group out of Canada (1WW) etc etc.

My own opinion is that country designated numbers should follow the DXCC listings. That way everyone would follow the same list.
>Also, what are the letters in between? For example: 14AT123 or 14SD123
>I assume that 14 is the division, but what about the letters?
The letters in between determine the club or groups name, IE; AT Alfa Tango, SD Sierra Delta or whatever.

This has always been confusing to me and therefor I only use my club numbers when contacting another member.

>> 100 watts on a sideband frequency of 27.355-27.405 and work THE WORLD !!!

Try telling that to some of the stations in the mid west or even out on
the west coast.

Not only do they hear Europe less frequently but they have to get past
all the far stronger stations down the east coast who only have water to
get across instead of several mountain ranges.

It is the same the other way round for us mobile operators here in
Europe. Working New England down to Florida is no problem, hearing and
talking to Utah, Idaho, Wyoming, Montana etc. is a whole different ball
game.

You try it sometime, even on SSB, and don't you dare turn the power
up:-)

CB1999 wrote:
>
> Breaking the rules is not my priority on the DX agenda.

Yes it is, Jeff. Getting a license is easy. So easy, in fact, that the only explination for your continued illegal activities is that you get a kick out of breaking the rules.

> My interests are the ability to communicate, PERIOD.
> And I don't want to become an "elite" by taking a
> test. I know the rules. And thats all I need.

But how do we know that you know the rules? How does your neighbor know that you can operate a radio safely without putting his family in danger? That was one reason why the FCC was created, you know? And that is one reason that the FCC put such heavy limits on the untested, and now unlicensed, CB operator, you know?

You would not say the same thing about other public activities, Jeff. You would not say, for example, that the auto driver does not have to have a license. By your argument, all that matters is that he knows that he knows the rules.

We (the other people on the highway) can only pray that he knows how to read the words on the stop sign at the intersection that we are both approaching. We have no right to expect that he take a simple test to prove at least some basic knowledge of vehicle operation (and a eye test to insure he can even see the stop sign).

And please don't try to claim that your radio operation is not a public activity. You're radio waves don't stop in your living room. They go out all over the country and can affect hundreds, or even thousands, of other people. Those people have a right to expect you to take a simple test to prove that you at least have a basic knowledge of radio operation.

Not absolutely accurate, Tim. Only 27 of the countries around the world teach any English in schools (we're talking about regular schools, not optional classes offered at colleges and universities).

I read this in a State Department brochure while I was in Italy. I remember it so well because I remember how few Italians understood English, even though they were one of the countries listed who offer English to their students.

Oh, I agree that the operation of these radios in the CB band could be threatened, but you suggested that the MARS/CAP operations were threatened (you said "good bye legal mars and cap operations" in your original message).

Enough said, perhaps we misunderstood each other.

This was sent to me by Silly813@aol.com

Two rednecks were sitting at a bar when a young lady nearby began to choke on a hamburger. She gasped and gagged, and one guy turned to the other and said, That little gal is havin' a bad time. I'm agonna go over there and help. He ran over to the young lady, held both sides of her head in his big hands, and asked, Kin ya swaller? Gasping, she shook her head no. He asked, Kin ya breathe? Still gasping, she again shook herhead no.

With that, he yanked up her skirt, pulled down her panties,and licked her rear end. The young woman was so shocked that she coughed up the piece of hamburger and began to breathe on her own. The redneck sat back down with his friend and said, Ya know, it's sure amazin' how that hind-lick maneuver always works.

toll free Im getting way off the subject but I said replace the lost oil not change dirty oil.

All I have to say at this point is if you dont like Dave Made Fine but if it is because you have to wait for it your childish.

This is a ture story I know a guy that wanted a dave made 32 pill but got sick of waiting and bought a no name 32.
Im Waiting now for a Dave Made 32 pill I Admit I would like to have it now but i know When I get it I am going to stomp all over the No-Name, not just because they are better boxes but as im waiting for my 32 im setting up my car. Making sure everything is well grounded, tuned, and what not. The guy with the no name 32 is running it off of one alternator. I took the time and saved up and bought three big leece-neviles AND YOU KNOW WHAT IT TOOK 2 WEEKS FOR THEM TO BE SHIPPED TO ME. But it beats buying them from some one that has them in stock and charges an extra $100.00

DO YOU REMEBER LAST XMAS WHEN THE FURBY'S WHERE THE HOT ITEM? I STOOD INFRONT OF BRADLES FROM 8:00 @ NIGHT TILL 6 IN THE MORING BECAUSE MY SON WANTED ONE BUT YOU KNOW WHAT HE GOT ONE. AND THE KID NEXT DOOR CANT SAY THE SAME BECAUSE HIS DAD WOULD NOT WAIT ON LINE.

IF THIS MESSAGE DOSENT CHANGE YOUR MIND YOU ARE IGNORANT.

There was an interesting article in this months Nuts and Volts about the Rat Shack. Basically, when they first started selling Ham / Scanner stuff back in the 70's all the mom and pop stores cried "foul", fearing they'd be run out of business.

Instead, they've actually seen an increase in business. Apparently, the Shack carries just enough stuff to get you hooked, but not enough to keep you going. For example, the intro to Ham Radio books, the police call guides, a few basic antennas, etc. However, to get anything really advanced or specialized, you have to order it or go to another store, like you did. These smaller stores have seen an increase in business thanks to this stocking policy.

Out of curiosity, has this been the case in your area? Sadly, right now we only have one store here in Birmingham that carries a good supply of Ham / Scanner stuff, and he is getting out of it due to internet competition. Rat Shack is the only other alternative.

Robert

Funny, I was about to ask you the same question.

Here we have 2 "texts" that same ALMOST the same thing, except for the inclusion of the aluminum alloy. The one thing that would give telfon a conductive property. Now since I know for a fact that teflon is used as a dielectric insulator in coaxial cable AND connectors, as well as antenna insulators, and that the presence of any conductivity would render the material unfit for these applications, I can therefore conclude that Teflon has NO conductive properties.

Elementary my dear Watson.....

It seems to me that any man in business has the right to sell or not sell any product he chooses. It also seems that a man in business has the right as all americans do to notify the readers of this NG of his intentions.Whats the big deal? Steve has made a decision and notified the group and his past and future customers of his decision.Some people are not pleased about anything. Thats the type people that Steve does not need. A few of the posters to this group have nothing better to do than to sit back and attempt to find something wrong with everything that someone else posts.If you don't like how he expresses himself, don't read his posts. If you don't like his business methods go elsewhere.A good day to all.

This, of course is all a matter of perception. Are the "RF police"
types, really copping an attitude, or do the fact that you know they
have ham licenses, somehow sours your opinion of them, and to prejudge
them negatively already?

> i'm not the one deflecting the arguement into a cb vs ham thing. those lines
> were drawn long ago by the hams.
> the general impression that comes across here a lot of times is that the "rf
> police" types believe that they were issued a badge with their ticket and can
> patrol the entire radio spectrum.

In some cases, this is true. The FCC often enlists the help of
volunteers to assist in evidence gathering. If the fact that there are
law abiding radio operators out there that are willing to do this,
bothers you, then so be it.

> the hams keep pushing the line that if you want to shoot skip and run power,
> get your ticket.
> it seems that if there were no problems on cb, the hams would ignore cb

Again, this is a matter of perception.

> if ham is the pie in the sky that they purport it to be, why do you even bother
> with something as rinky dink as cb when you have hundreds of megahertz of
> spectrum assigned to you that goes mostly unused?

CB is much more informal, and, when it isn't abused by lowlifes, can be
a great social gathering. Many hams that I know, do their "serious"
radio on the ham bands, and then "let their hair down" on CB.

> in the case of the out-bands, if the hams arn't suposed to go there and
> assuming that we don't stray into 10 meters, our activities there shouldn't

> concern you at all.

> with all of the purported benefits of ham, cb must look like the old 100mw toy
> walkie / talkies of days gone by.

A 1999 Corvette is technically superior to any of its predecessors, but
many people like the charm of the older ones. Same with Ham and CB.

>
> This is not the case.
> >It's is more a "clean, decent, law abiding, respectful vs. selfish,
> >arrogant, scofflaw".
>
> the "rf police" always come back to the "scofflaw" arguement.

Because that is the basis for any and all complaints. But even if you
are the type of person that feels justified in selectively ignoring laws
that you don't think "apply" to you, I still feel that anyone that
deliberately tramples on the rights of other people, is more
contemptable than someone that ignores a law like jaywalking.

> they always pull this one out of the hat whether they are into cb or not, again, just >
for the sake of having something to bitch about.

Again, a matter of perception. Most people don't bitch just to hear
themselves bitch. They are more likely to be truly concerned with the
state of the bands that they use. The point that you can't seem to grasp
is the fact that "lawless" operators are reducing the pleasure for other
people. It's not a matter of "I'm not bothering anybody, so why bitch".
In many cases you *ARE* bothering someone, and they have a right to
bitch.

> if you see someone on the street beating someone with a baseball bat, by all
> means jump in and stop it. with all the bitching that the "rf police do here,
> it's akin to turning in everyone who drops a gum wrapper or j-walks across a
> deserted country road at 12:00 am. but doing it with much vigor.

And that is the problem. You don't understand the harm in what you are
doing or defending. You compare it to "crimes" like Jaywalking, where
YOU are the only one at risk if you break the law and an accident
happens. When you operate illegally on CB, you have the potential to
affect hundreds of people. How would you feel if your neighbor decided
to run his chainsaw during the wee hours of the morning, while you were
sleeping? What, you say, there are laws against this? What if your
neighbor didn't feel that this law "applied" to him? You'd want to
bitch, wouldn't you?

We were 16 year old kids. How would we have successfully challenged
this? We had no real proof of any wrongdoing. We were just held to a
"(much)higher" standard than the normal applicant. Where others might
have been cut a little slack, we had to do everything 100% correct.

> what if he made a lot of broad assumptions about who was causing him problems
> and some innocent kids were unfairly failed just because he assumed they were

No, he knew who we were. He was able to gather information about us from
our almost constant afterschool chatter, and possibly a little DF'ing.

> you and your friends shouldn't have layed down and allowed your selves to be
> steam rolled this way just as i / we won't lay down and be steam rolled by a
> bunch of high horse riding, holier than thou, hams who think they have a
> license to control other people.

Big words, but again, how do a bunch of 16 year olds fight the system,
with no substantiating evidence, or money to hire legal representation?
As it were, we didn't realize what had happened until after it was all
over. We just thought that the test was just REAL tough. One of us
somehow met up with the guy a some later time, and words were exchanged
and he let something slip out. Then we all put 2 and 2 together.......

> your authority over illegal radio operations is restricted to the same
> procedures as any other citizen who has an interference problem.
> you have the right to inform the fcc of your concerns and assist them in any
> way that you choose. THAT IS ALL.

I don't know. Maybe there is the same sort of drive that makes religious
people want to preach to the "unsaved". There are a great many CBers,
who run illegally, and really don't know it, or realize the consequences

of their actions. For every person that says "Yea, I know it's illegal, so what?", there may be a one or more people that may say "Wow, I didn't realize this would do that."

> now on the other hand, if you were to approach me / us and get off your high
> horse and look me in the eye, man to man and express your opinions, we could

Because in most of the rest of the world, people still respect (And in some countries, threatened with deadly force if not) laws and rules. There is no need for "RF police", becasue the people don't flagrantly break the laws to the extent that Americans do.

> >I think this "stuck up hams" stereotype has gotten inflated far beyond

I am fairly loose on the definition of "average intelligence". As long as they can carry on a decent, respectable conversation, and have a little fun, without carrying on like a total idiot, then I'd say they have "average intelligence". We're not talking Mensa here.....

> someone who is less mature than you may seem childish but someone who is
> more mature than you may get a mental image of you as an adult in diapers.

I doubt it. There is a level that once you reach it your maturity is not questioned. Some may be "more mature", to one degree or another, but generally speaking, maturity means that you don't act like a 12 year old.

> everyone is different but the elitest, intolerant, inflexable and single
> minded "destroy the varient cb'er" attitude that you and other hams display
> here really doesn't help your credibility either.

Tolerance. Just what do you consider tolerance, and what are YOUR limits? I have no tolerance for Butt-heads, who act like mental midgets, and play games like little kids. If that is intolerant, in your book, than so be it. Other than that, I am EXTREMELY flexible. I, more than you know, understand the differences in personality. If a CBer, or any radio operator, misuses the privileges that are given them, then they deserved to be "destroyed" (your words). Play the game by the rules (And not necessarily the FCC ones, I'm more concerned with the rules of society), or don't be surprised if you're asked to leave.

> especially if it's on frequencys

> none of your or any other hams business, it is?

You're right, I don't care what goes on on the freeband. And you won't hear me complain about people who operate there, unless they run really dirty "Joe Screwdriver" radios, and wipe out my QSO's on either 10 meters or the legal 40.

> even the OO's are supposed to be monitoring the ham bands and not the out
> bands or cb.
>

No, that is YOUR interpretation of what's happening. I see it a little differently. I see a growing number of people who are getting tired of always being stepped on and forced to deal with a group of people who have no concept of what it means to be a good neighbor, and who are now starting to DO something about it. If you start to see a growing number of volunteer CB OO's, policing the bands, with the FCC's blessing, don't be surprised. It's been a long time coming. After all there wouldn't be a movement to localize radio enforcement, if there weren't a problem on CB.

You can't blame these people for fighting for what they believe in.

Everyone seems to hate hearing this over and over, but the rules are the
rules. You want to work DX legally, you have to take the test.

I know there are some hams that are very "stuck up", but in my
experience, it is far from the majority, that the overgeneralized
stereotype would have us believe.

>
> >Reality is that hams are very friendly to people who act responsibly.

So, in your mind then, a person who acts "human" is one that disobeys
the common rules of society, and courtesy, and who is as dumb as a
stump? I'm sure there are alot of humans out there that would find this
revelation to be a bit insulting.

You tell me. You guys are so great at stereotyping and generalizing ham
radio and the people that are on it, you should have a fair idea of how
a "CBer" acts.

Someone wanted a definition of a CBer. This seems to fit the mold fairly
well, for today's typical outlaw CBer (Complete with moving arms and an
ready to use ATTITUDE).

Amen!

I would also point out that the lack of an amateur license implies neither stupidity nor laziness but rather is the sort of elitist attitude that violates the best traditions of amateur radio, not to mention common manners.

Siltronix 1011D "Comanche"

The Siltronix is a side band transceiver is designed to be used in SSB or AM modes. Frequency range is 26.94-29.0 Transmits and receives on 11 meter. 300 watts P.E.P. 100 watts AM. This transmitter is not so great for AM but does great for SSB. This radio has a tendency to drift and therefore earned its name "Sliptronix". When left on for a long period of time it reduced that problem considerably. This is a older tube radio and comes with a Turner Plus Three microphone and manual. This radio is in great shape cosmetically. Below is a pic. of this radio, the speaker in the picture is not included in this offer. The pic below is a 1011C mine is a 1011D, they look the same. $200.00

Hi, I recently bought a pair of uniden handhelds from Walmart for about $50 but am taking them back because they have no external power jack and batteries would get expensive. They have a Maxon there that has the external power jack and a couple more features. My question is: Is the maxon a decent radio at $44 or should I spend the extra $20-$30 and buy a midland or cobra? It will see most of its use in whichever pickup I am driving at the time and will probably go with me on a few fishing trips. Thanks in advance!

1178. Antenna help?

I have a Wilson LiL' wil antenna(magnet mount). It is mounted on top of the roof of the car. The car is a 98 ford taurus and the trunk is not metal so a magnet will not stick to it. My problem is I get a huge amount of noise from power lines on my recieve sometimes to a point that i can't hear more than a half a mile. this is only a problem at night when all the lights are on. It does not do this in m y other car. My question is, can I do anything about this? I cannot get away from a mag mount because it is a company car and drilling a hole is not an option. any help is appreciated.

I am looking to buy a new or used (good condition and working) Yaesu FT-23R, modified or non-modified. The one a friend has is equiped with a key pad, I would like this feature or info on how I can equip one with a keypad if possible. I found a place to buy one that is 5 watts, but the man said I cannot put a key pad on it. I dunno if he is right or not. Could you please send me any info about this radio. Thanks ryan

1183. Re: Clarifier need to be opened on Lincoln?

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: MC Turner <c_turner@ix.netcom.com>
Message-ID: <38270FFD.B73F31A1@ix.netcom.com>
Source record: 9520

Mike.. The thing to remember is that the Lincoln has a VFo that controls Transmit and Receive all the way down to .1 KC's It is actually possible to turn the VFO from 26 mhz to 29 mhz! but it would take a long time. The 2510 has no "clarifier". It does have a R.I.T control that only slides the RX a few KC's so you can touch up people that might be off by a small amount. Performing a modification to make the R.I.T control slide on transmit is totally Idiotic. If you do you will get an unstable transceiver. Not to mention that the VFO and Freq counter will not be accurate. For example. You may turn the VFO so the counter reads 27.4550 but if the modified RIT is off a bit then you are not really on 27.4550. You may be of a KC or so. The freq counter reads the position of the VFo and not the actually frequency.
Some people have there RIT modified because they are used to CB's with only a Clarifier and no VFO. On a rig like that it is necessary to open the Clarifier up as 90% of the other guys have there's opened. If yours is locked and there are a few other guys that are all tuned in slightly off CH then everybody would have to retune to you. I personally would rather have everybody locked but since the fact that most have them opened and they do not have accurate counters(or counters at all!) I recommend that people have the clarifier opened for SSB on CB radios....

MTI. Marine technology inc. they make filters that will stop the noise. find them on the web. I would try some caps on the pump and maybe some ferrite chokes first though. Oh by the way hard mounting the antenna will not stop the noise..

i had 2 ford tempos that the electric fuel pump compleatly killed the recieve
on my 2510.
go to radio shack and buy a feed through capacitor. they're about $7.00 and the
size of a roll of quarters and work like a dream.
they're easy to hook up and the directions are on the back of the pack. don't
let rad shack sell you anything else as i've tried them all and they didn't
work. this was the last thing i tried and wished it were the first.
i don't know what kind of car you have but on mine, i had to cut the b+ line to
the fuel pump as close to the pump as possible which entailed removing the back
seat and accessing the wires from there. they were right there in plain sight.
some cars like my fords have 3 wires to the pump.
1) ground, 1) b+, and 1) for computer feed back. the feed back wire will also
read 12 vdc on a volt meter. DO NOT use this wire as it won't help the problem.
maybe call your dealership for the color codes for your pump.
cut the b+ wire and connect the 2 ends, one to each end of the cap and ground
the ground lug on the side of the cap to the body and you're on the road.
mine worked so well that i had to put the speaker on my ear to hear any noise
at all and then it was hardly noticeable.
good luck.
jeff

On the contrary, this was directed at the masses. The words "illegal" and "Sporadic Waves" happened to appear in the same context and I just wanted to clarify some things that MAY get misconstrued. You are correct sir, nowhere did I infer or imply that you were incorrect. Nor did I imply that you were correct. I also am fairly secure in my knowledge that nothing was taken out of context. Writers question everything that piques their interests. I felt I would add my own thoughts once I read something of close proximity among these posts. I do no condone or rebuke any one for their opinions. As for the flames I referred to, I meant the flames I was anticipating myself after my post. As I stated in your personal reply, you are more than likely a fine radio operator. No attacks from this origin. I believe eveyone has the right to read whatever they wish and operate however they wish as long as they bother noone else.
Happy DXing and hope
to hear you on the "off"
frequencies.

>such a radical idea anymore.

<<IF??? seems like its been going strong in its same form since the
60's and 70's. if thats not steady i dont know what is.>>

Hm. I was on CB in the 60's. I heard nothing on channel 6 that
resembles what you hear there today. Even during sunspot
highs.

But your point that the SuperBowlers have been "active" for
"more than a few years" is noted.

<<How much longer do they need to be on???>>

Until what?

Just because I squat on someone's property for 20 years
doesn't mean I own it. And in any case, I don't think the
SuperBowlers have actually "improved" the state of the
band or contributed anything to CB except QRM.

My point was that unless the SuperBowlers are actually
willing to take the steps necessary to find a piece of
spectrum where they can legitimately "compete" without
trampling on the rights of the general public, then there's
no "sport" about it.

>>if i parked my mobile at the club house and keyed up on channels 1 through
>12,
>:>no one there watched tv untill i un-keyed.
>:>stock mic and radio, no amp, trunk mount antenna.
>:>wiped out 4 tv channels. front end overload into their distribution amps.

here's the lowdown for you.
first, put the bottle down and sober up when you try to read these posts.

second, this was, as i had stated, 24 years ago. a lot of rf under the bridge, radio's gone and i know a lot more now about keeping my radios clean. you never pulled any teenage pranks when you were a kid? get off the shitter and come into the real world.

third, what does earth ground and ground rods have to do with a MOBILE???
i'm sorry but i'm too lazy to drop an 8 foot ground stake every time i park my MOBILE and key the mic. not to mention that most property owners don't like ground stakes sticking up out of their parking lots when i leave. once they're sunk, they're kind of hard to pull back up as i'm not a SUPERHAM.

fourth, who said anything about 26 to 28 mhz? as was stated in my post, it was a 23 channel unimetrics marlin 1, STOCK, stock mic, NO AMP.

fifth, one thing i didn't mention was that the problem was cured with a low pass filter so apearently it wasn't the coax.

>Oh by the way sonny

oh by the way ass hole, i'm not your sonny.

>Just like a 911 call, soon as someone reports
>you, that's all they need to enter the QTH and have a look.

this is out and out bullshit. in case you haven't read the news, hitler lost the war. they would need a lot more than a phoned in complaint to just walk in and search a house. they know this and collect a lot more evidence than a phone call to just walk in and have a look.
with an attitude like yours, you would probably get visits on a daily basis from reports from your neighbors who just don't like you.

>If you are legal and have good RF grounding, not to worry.
>If not, then better start hoping the judge hasn't had any
>experience with CB splatter at home. Oh yeaaaaa

let me give you a senerio.

if you a neighbor of mine and reported me for rf illegal activities and happy hollingsworth came knocking on my door ON YOUR SAY SO ALONE. he wouldn't have

probable cause ON YOUR SAY SO ALONE to enter my QTH for an inspection.
if he were to force the issue and didn't find any illegal equipment, you AND he would be sitting side by side at the same defense table in court when i bring a HIGH PROFILE law suit against you both for an ILLEGAL search of my house. i would sue the paint right off your walls so i would be careful making such threats to people in the future if i were you.
he would have the right to inspect the equipment AT MY OPERATING STATION ONLY and not the rest of my domicile.
i guarantee he won't find anything illegal at my operating station.
trust me, i have thought this out.
OH YEAAAAA!!!
i don't condone most activities that the rf police complain about here and yes, i do bend a few rules once in a while. it's been 24 years since i've operated a dirty radio like the one posted earlier.
the main arguement that i have with the rf police is that they don't have the right to come in here like gang busters and start ordering people around with threats and intimidation like the one you've posted here.
we know the rules and are willing to accept the consequences, if any, for our actions and rarely do any of us ask for any input from the ham community yet we keep getting spammed and blasted for excersizing our right to free speech here.
bottom line to you and all the others who got their cracker jack box badge with their ticket is, BUTT OUT, NO ONE ASKED FOR YOUR OPINIONS.
jeff

This is something that I wanted to comment on as well. In the mid 70's our locals had a CB club, and our home channel was channel 6. There was nothing of note, other than the locals, running there. When the skip rolled, the noise on 6 was no worse than any of the other 23 channels. I can't say for sure when "the bowel" started, but my first recollection of their activities didn't come until the early 80's.

In the countries I have visited the main thing that seperates ham from CB and other non-ham is the ability to speak english,and they all want to be hams,just like many here are too lazy to learn and be tested on a little radio knowledge many there are too busy or don't have the means to learn english so ?

Try a large cap. across the leads as close to the pump as possible and
possibly to ground.

icecoldnyc@aol.comICECOLD:
<<If it wasn't for this internet bullshit, probably 90% of you guys wouldn't even know anything about keydowns and where to get amps....
There are only a few amp builders who have been selling before the internet and still are. Most of the builders you guys talk about, except davemade... are all new and are really internet made amps!!!!!
ICECOLD is out!!!>>

Brings up a interesting point, Ice. First time I became aware of your "sport" was when I was driving up Interstate 5 about six years ago listening to my FM car radio. I started hearing highly stylized CB chatter on it - getting louder and louder by the moment. When it was loudest, I looked to my left and saw a Chevy Suburban passing me - festooned with an odd looking (to me) copper coil antenna. The driver appeared to be having a great time - and didn't seem to care that he was blasting through the front ends of car radios on the Interstate.

Sadly, this attitude seems to be the hallmark of your "sport", i.e., enjoying yourself at others expense. Also, as you point out, several new amp manufacturers have sprung up to exploit the demand for competition class CB amplifiers. These guys don't give a hoot who buys their products. The fact that a lot of non-competition CB users now feel the need to buy these amps "to be heard" on today's band is a happy bonus for the manufacturers. More amps sold = more QRM, more aggravation = more amps sold.

So if the competition crowd has contributed anything, it's the proliferation of higher power levels, more QRM, and a lousier band for everyone. And I won't even mention the RFI they cause to consumer devices.

It's sounding less and less like a "sport" to me.

Hi, I'm wondering if you had the following to connect in series,
where would each go.

1.radio
2.amp
3.Antenna tuner
4.swr\power meter

Currently I have the following in the above listed
order. The thing that makes me wonder if the connection
order is right is that the radio has a built in swr meter,
the swr meter inline, and the matcher's swr. Which should
I be looking at? Currently I adjust the ant matcher to show
the lowest swr reading on the swr\power meter thats connected
before it. Sometimes I try balancing the ant tuner's swr with
the swr reading on the swr\power meter. I rarely look at the reading
the radio's swr meter gives

Any thoughts on this would help.

Very true, It works both ways and it seems davemade decided not to sell to him any longer.

. It also seems that a man in business has
the right as all americans do to notify the readers of this NG of his
intentions.Whats the big deal?
==========
What purpose did notifying the NG serve? Go to his web page and you will see what he is selling or not selling. He actually wasnt selling davemade amps he was using them, whoever inquired about davemade he tried to move them into an x force. There are many people out here who can confirm this. Hell he never notified anyone about his discontinued sales of the Cookie amps. Why is this. Because they are not a threat to his x force sales. --------
---

Steve has made a decision and notified
the group and his past and future customers of his decision.Some people
are not pleased about anything. Thats the type people that Steve does
not need.

A few of the posters to this group have nothing better to do
than to sit back and attempt to find something wrong with everything
that someone else posts.

Sounds like you are starting to fall into the same category as the people you are talking about Steve cast the stone and people are answering to it, you are not pleased about that.

If you don't like how he expresses himself,
don't read his posts. If you don't like his business methods go
elsewhere.A good day to all.
==========
If you don't like what anyone has to say you can take your own advice. The smart people will see an attempt to put down.

Greetings!

Well, you have a Lil' Wil' antenna.

One problem, what is the radio?

With any mag-mount, you'll ned a radio that has ANL - Automatic Noise Limiter, and NB - Noise Blanker.

And since it's a company car, I take it you're using the Cigarette Lighter for power...

Hmmm...do some checks...

Plug in the radio, don't start the car. Listen to the radio.

With skip rolling, this should sound pretty noisy. Noisiest times are near the morning hours, just after sunrise, pretty much all day, then noisy at night just right around sundown. This is Skip, a propagation event. The earth's ionosphere is active during the day by sunlight and the extra oomph provided by sunspots.

Once thats been determined, now onto the next step...

Start the car, and listen to the radio. Then without keying, or transmitting on the radio, disconnect the antenna.

What happens to the noise?

If it disappears, or it's gone. The problem is with the radios ability to reject, or filter out noise while the engine is running.

Or it's it's still there only less in volume?

With the above in mind, you may need to get a better radio.

Not trying to insult, just some "portable" radios are just that, portable, with little to offer in features to help make the radio more enjoyable.

If you need some steps, nd since you have a company car, it can at least offer help in determining where and what kind of, noise you're getting from the car...

http://www.iserv.net/~codyspc/engine.htm

It's a basic primer...but if you follow through on the links provided, you'll get a better idea and there is a "test" you can take that can help you determine what you're up against.

While Dancing with the Mouse on 08 Nov 1999 16:58:17 GMT, the Modem interrupted with an MNI from "cgo2541273@aol.com5200 (Charles Golden)", and the MotherBoard buffered this to Video RAM:

I will avoid personal attacks like the ones you have posted calling some one "son". This is a direct conflict with what these postings are SUPPOSED to be about. I will abide with the issue at hand.
I find myself quite amused that you take what you hear and read quite literally. I have been investigating the Feds. underhanded dealings concerning global communications for almost a year, as part of my studies devoted to journalism.
Have you ever heard of spin? Propaganda? The FCC is inundated with such high-tech crimes such as cellular cloning and computer related crimes. What you are hearing and reading is complete hyberbole and spin. Simply put, this is another political maneuver to get the cash flowig. It has absolutely nothing to do with enforcement of radio. I now what he has said he was going to do. I know he is going to streamline, reorganize, etc. Pure hype. This is akin to a politician telling his costituents what they want to hear to pacify their whetted appetites to appease the here-and-now. You are welcome to believe whatever you like. Take it from somene who has been denied countless interviews, granted a few, and no-commented to- death when it comes to who really is in charge at the FCC. If you believe it's saviour time, you have one hell of a wake-up call pending you my friend. I can supply you with hundreds of hours of interviews from the NSAs covert Echelon global spy communications system(monitors ALL modes of communication for "key" words) clear down to the FCCs local, regional and National Directors comments. Who you think is in charge isn't, and what you think will take place, won't. The resources simply are not there and congress' pending vote on the current bill is unlikely to gather the muster to pass. Even if it does, the allocation of funds is the equivalent of just a few dozen or so added employees. No, your messiah is a false god. What will likely take place SOMETIME in the future, is that local municipalities will be given the jurisdiction of enforcing their own areas. But this is old news. Like I said, you are free to believe what you like and no one will think ill of you for it. But these are the facts. It is my profession and my passion to educate the public.(I am a writer) Especially when it comes to Big Brothers Bull. There are many avenues for you to obtain the true information on what is truly taking place. Unfortunately, the gentleman who now claims he holds the reigns at the FCC has not the power or the status that you so graciously allow him. But with a few more posts like yours, I am sure that "Camelot" is just over that next hill.....

They can also do what they have done with HF amplifiers..

Make one radio an EX or E or ??? version, sold only when the buyer is an exporter.

That is the way that many Henry amps (as well as all others) are brought into the country with 2 holes in them, 10 meters on the faceplate, etc....

Sold under the guise of "export only" units.

The same can be done for the microcoding of the radios...

Kinda like the President George... Only the coding got out about how to change modes on it.

> because they are better boxes but as im waiting for my 32 im setting up my
> car.

I think you will be comparing apples to oranges.

Give the guy with the No-Name your Dave for a night, and you run his
no-name. I bet you maul him.

Waiting has nothing to do with the vehicle setup.. Nothing at all. Please
don't attempt to confuse other people by plying it like it does.

Making sure everything is well grounded, tuned, and what not. The guy
> with the no name 32 is running it off of one alternator. I took the time
and
> saved up and bought three big leece-neviles AND YOU KNOW WHAT IT TOOK 2

> that has them in stock and charges an extra $100.00

I purchase Leece Neville alternators for $160.00 brand new here in Houston.

And I don't have to wait but a day if he is out of stock, as their is a Presto-Lite distributor here in town, and another large wharehouse in Bryan, Texas.

Bet if you looked, you would find a distributor in your town that would sell them to you for nearly the same price. Not rebuilt, new.

What does that say to me.... That you are a fool with too much time on his hands.

The Furby is sitting in the bottom of a toybox, or on a shelf now, doing nothing. In return, you wasted an entire evening, that you could have been at home cuddling with the wife, or whatnot, but chose to stand outside a store to purchase a stupid doll.

I feel for you... On prozac then, I dare ask?

I don't believe that he trashes the band at all.

Let's see...

He runs 25 watts PEP into an Antron.

BOYEE.EEEEEE...

That is raw power their, huh?

I bet he can skin a cat just with the ERP from that station.

Your a troll and a leech.

Have a bad day.

No, usually the Machlette parts are not very good for HF range RF... Either
LF or VHF..

They are a commercial "name".

Was it Calif Elect. or Murphy's?

Let's take a good look at this idiot, shall we?

> LOOKING TO TRADE MY ALMOST NEW COMPAC ARMANDA

You mean, Armada, right? Discontinued line.

1530DM 166 MHZ PENTIUM MMX LAPTOP

WOW! You have an almost new laptop that hasn't been made in two years!

That is cool!

FOR NEW OR PERFECT BASE, LAPTOP HAS ALL THE BELLS AND WHISTLES . CD, HARD DRIVE. MODEM WINDOWS 98.

WOW! It has a hard drive in it?

28.8 modem, too, I bet.

COMES WITH NICE CARRING CASE. BOUGHT IT FOR 1800 FROM COSTCO 1 YEAR AGO.

So you got a laptop that you say is almost new, that you bought a year ago, paid too much for and are now trying to pawn it off on the rest of the world?

Got news for you... I got a Toshiba Libretto 166 MMX with a 4.3 gig hard drive, 32 meg of RAM, 10/100 / 56K Xircom card in it, the whole 9 yards..

And I paid less than that, that long ago!

You got had.

Don't expect to get something for nothing. That laptop is advertised by the computer resellers right now for less than 300 dollars.

Sorry to burst your bubble, but buyer beware, and next time you want a computer, go to a computer store, not CostCo. CostCo sells manufacturers one-offs, overstock and second rate merchandise that either didn't do very well in the stores, or didn't ever need to be produces.

> PROBABLY COULD GET 1000 ON EBAY.

I looked.

A P-120 was going for 300 dollars.

A P-2X266 was going for 400 dollars.

Guess again.

DONT WANT TO HASSLE FOR IT.

You mean don't want to be laughed off EBay.

> PLEASE EMAIL FOR PHONE INFO.
> THANKS

Your welcome. Please try to be a bit more reasonable next time.

It should go

1
2
4
3

Then, use the #4 meter to match the tuner, and read the power output of the amp.

Use the radios meter to find the match that the amplifier presents to the radio.

1232. HTX-10 Product Review

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: Harry <N5JOY@hotmail.com>
Message-ID: <38277ADA.1573FA20@hotmail.com>
Source record: 9617

This is copywrite 1999 by K7JOE, all rights are reserved.

Ladies and gentlement,
Having gone into Radio Shack yesterday to buy a couple feet of RG-8X coaxial cable, I came across a new offering in amateur radio gear. The new Radio Shack HTX-10 10 meter HF mobile radio.

Unit tested is serial number 3xx, so one of the first out of the gate.

This is a new entry into the 10 meter mobile market. Here are some features:

Freq Coverage: 28.0 - 29.7 Mhz
Modes: AM, FM, LSB, USB.....there is no CW capability
Power: 25 watts nominal LSB, USB, FM. 8 Watts carrier on AM.
Freq Tuning Rates: 100 Khz, 10 Khz, 1 Khz.
Fine Tuning: moves both TX and RX frequency +- about 2.5 Khz
Accessories: mobile bracket, mic, and power cable.

Upon seeing the radio, one does a double take -- the radio looks almost identical to the current offering of SSB CB radio. The noticeable differences are few: The 10M rig offers an up/down microphone, the 10M offering says "10 meter HF transceiver" on the face plate, and thre 10M hf radio has a significant heat sink on the back panel (integrated into the back panel actually).

Powering the rig up, one notices the very bright LCD display and backlit

volume, squelch, channel/frequency knob, and mic/rf gain knob (concentric knobs). The six multi-function buttons are not back lit, but are labeled in white lettering.

Hookup uses a now-industry-standard T type molex cable. I simply unhooked my Kenwood 2M mobile and plugged this into the car. Antenna used was a 8 foot whip for 10 meters.

What's good: SSB TX audio reports were excellent, though I did tend to over drive the radio. Adjusting the mic gain from full blast to about the 1 oclock position helped. Power out on my peak watt meter indicated

27 to 28 watts of RF out on SSB, about same on FM, and about 9 watts carrier on AM. The Mic and RF gain knobs are dual concentric knobs on the shaft...be careful to adjust only the mic gain down, and not the RF gain too!

The noise blanker is excellent -- very effective with ignition noise.

This radio does repeater splits, and the splits can be programmed. When first getting the radio, it was programmed with a 600 khz split! Gee, I thought -- perhaps a tech at the factory in Korea programmed the radio thinking it was a 2M rig perhaps? since the normal 10M repeater split is only 100 Khz. But, this is easily reprogrammed with a few keystrokes.
Too bad -- the radio does not provide CTCSS encode like the HR-2600. SO, you are restricted to carrier operated repeaters only, or need an outboard tone encoder to access toned 10FM repeaters.

There are 5 memory channels to store favorite frequencies, modes, shift,

etc. Nice.

Band scan is available and is carrier operated only. Memory scan is not

available/offered.

Interesting to note the output in FM is a full 25 watts. Not sure how it will hold up in that mode for continuous duty....hmmmm. Most of the other offerings gave significantly less output on AM and FM compared to the less heavy duty cycle modes like SSB and CW.....time will tell.

Ergonomic comments: freq selector is obviously from it's cb brethren --

it is clickety-clack and no different in size from the other knobs. The six multi function buttons are not back lit, and white lettering could rub off. The clarifier (Rit/Xit) knob functions as a "f" button (push it to get to the sub-menu) -- I found myself moving the transmit/receive frequency when hitting the button. Could have put the F-function on the squelch button instead...my opinion only. Mic is light weight and cord is not really good "flexible" one -- kinda stiff. Microphone jack is not the normal 8-pin connector or 4 pin connector that's common on ham gear. Nor is it the new modular jack connector -- it's an odd 6 pin connector. Not something RS stocks now, and probably a 5 or 6 dollar item at mouser, if you can find it at all.

There is no provision for VSWR meter, though there is an S/RF meter at the bottom of the display. Frequency resolution is only 3 digits past the decimal point, so, probably not ideal for the digital modes (though the fine tuning/clarifier does move both TX and RX frequency to zero in on an exact frequency). There is no provision to turn OFF the RIT/XIT. They are tied together and "on" all the time.

Received audio distored slightly at higher volume levels, but an outboard speaker helped a lot. Use one if going mobile, I suppose.

Under the hood: Wow, have 10M multimodes changed in the past few years. No point to point wiring. 2 circuit boards only -- one main board, one display/front panel board. All surface mount technology. Decent looking crystal monolithic filter. The final amplifier transistor line up is the familiar 2SC-1969 -- capable of about 15 watts

PEP each. There are two transistors, running in class AB1 configuration. Nice to see a commonly available (and relatively inexpensive) final PA being used.

The board components and variable adjustments are NOT labeled. Disapppointing, since tandy's HTX-100 was well labeled for ham adjustment. This one will need a service manual. Worse, there was no schematic diagram enclosed. This was real disappointing for a "hacker ham" like me.
Overall, Tandy should be complemented for hanging in on the ham market. The sad news is that the products are getting "cheaper" both price and perhaps quality wise. The recent entry in the HT line is certainly no HTX-202, and, I dont believe this HTX-10 is constructed as well as the HTX-100 was (a Uniden clone running CW and SSB only). FYI, the 2M radio -- the HTX-242 mobile is now discontinued -- interesting to see what is brought out as it's replacement.

At $149.95, this looks like a fair value for the new "code priveleged" ham. Bear in mind it is lacking CW capability (perhaps a sign of the times to come) and has some of the shortcomings noted above. At the same time, it is very competitively priced, offers 25 watts of output power, and is available across America.

Toll, Nonames are more along the lines of the Dominator, Skullcraka, Foxy
design
slightly different tuning, combining, transformers etc. I thought they were
a direct copy until I actually saw one firsthand.

Yes, the 5000 is built 10 times better. Go to a local cb store / shop and ask to see there cutaway 1000's & 5000's. You'll see for yourself or check out the web site. The web site won't be as convincing.

1239. TRC-496 and Wilson 1000

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: Bill <br1@megsinet.net>
Message-ID: <3827C01F.3B39@megsinet.net>
Source record: 9624

I am a newbie to radio, `don't have a clue. Please help.

I have a TRC-496 w/ a Wilson 1000 mag mount. That doesn't seem to transmit and recieve very well. I understand that the radio is made by uniden and I wonder if there is a mod for it.

And would a pre-amp for the attenna help? What is a pre-amp? What should I look for? Are they exspensive? I live near Coppers (www.coppers.com) but don't know what to get.

Any and all help is appreciated.

Thanks,

Muley

1240. FS: B&K 1801 Counter

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: Bill Grassa <grassa@mpinet.net>
Message-ID: <38278F2E.84DAAF6E@mpinet.net>
Source record: 9625

Built for the B&K 2040. The Counter is perfect shape and is calibrated.
With the deal I offer another1801 for parts as well.2nd unit is in tact.
Can be seen at http://home.mpinet.net/grassa (upper left)

$80 for both.

Bill

1241. FS: Leader CB Signal Generator

Newsgroup: rec.radio.cb
Date: 1999-11-08 00:00:00 UTC
From: Bill Grassa <grassa@mpinet.net>
Message-ID: <38278E87.36B9DAD1@mpinet.net>
Source record: 9626

Built for CB Testing and Repair. This is a Leader LSG-227. Some features
are :
1) Center +1, -1 and adjustable frequency to +/- 5 Khz.
2) PLL 40 channel.
3) Mod Output 400Hz , 1Khz and 2.5 Khz.
4) Modulation adjust from 0 -100%.
5) Calibrated output from -110 to -10 Db.
6) Twin Meters.
7) ANL/NB Tester.
8) Delta , Led's , ect...
9) A bunch more.

Almost like the B&K 2040 except made by Leader and a tad smaller.

Can be seen at the top center of the picture at
http://home.mpinet.net/grassa

$275 Shipped.

Bill

Joe,

Can you comment on the internal board in comparison to either the Eagle Sidewinder 400 or the RS 11 meter offering radio?

Trying to find out if their are any similarities....

Other than that, nice review, well thought out, and looks like this just may be a decent rig after all....

One thing, I would bring the carrier power of the FM mode down to 15 watts.

The 1969 doesn't like more than about 8 watts AVG power output each.

Don't forget channel 18 and 23 where also the "big boy" channels at one time.

Then, everyone migrated to 6, and the boys who couldn't make it on 6 moved back to 11.

The white boys (the majority) that couldn't spend the money necessary to run on 6 last sunspot cycle moved up to 26. Usually you would find sweep tube amps their, and nothing bigger than an M4V.

Look on the amateur radio groups..

You can also shoehorn a swan 350 transformer in that radio, although if memory serves me well, the B+ will be a little high.

Old sweep tube amp transformers will work, too... Especially the ones that used all the grids in the tubes! :-0

can't
> i?

Yes, that will work, however, your average power output on SSB will drop to
near nothing that way.

The limiter is their as a psuedo-compressor... Take it out, and you lose
SSB capabilities..

Leave it in, and mod the radio other ways, that only affect AM operation,
and you still have a kick-ass SSB radio.

.....snipped.......

I heard a story of a man working as an mechanical engineer that
retired from a position after 20 yrs service to this company.
Upon retiring from this company, he hung out his shingle as an
consulting engineer.
Not long afterwards, the same company he worked for came to him
with a problem. The problem was one of the machines that the
engineer had cared for during those many years had decided to give
up the ghost and the remaining staff were unable to correct the
failure.
Almost reluctantly, the engineer agreed to take a look at the
broken machine. After a bit of testing, figuring and some head
scratching he made a mark at a precise spot on the outside of the
machine. He said to the other mechanics, "drill here" and proceeded
to create a bill of $40,000 which he gave to the Accounts Payable
department.
The owner of the company thought the bill excessive and returned
it unpaid with a request to itemize the bill before payment would be
made.
The engineer itemized the bill stating $1.00 for the chalk to
mark the spot and $39,999 for knowing where to put the mark.
He got paid.

1262. Getting Paid

On numerous occasions I have seen stated that a shop is charging
too much for what seems like a minute amount of work in a radio.
This kind of comment always kinda' stuck in my craw. I would
usually think to myself, "if it's that easy why don't {you} do it
and save yourself a few bucks?"
For those of you not in your own shop {defined as paying rent
for a store front} that feel you are being taken advantage of, I can
finally say out loud...."Kiss my fat freckled ass! That's what the
price of ignorance is going for these days!"
There! I finally said it. Whew! I been dying to say that since
1974. I feel much better now.
Ok, let the flames begin.

Digital Radio Systems Tested

Tuesday, 2 November 1999
W A S H I N G T O N (AP)

COMPANIES TESTING a new breed of radios that hold the promise of clearer sound and could give consumers data like stock prices and traffic reports now have federal guidelines to help them bring digital radio to listeners.

The Federal Communications Commission this week outlined benefits listeners will get as analog radio becomes digitized. An FCC proposal gives companies that are designing and testing digital radio technology a road map for achieving these goals.

Using the language of computers - 0s and 1s - to transmit information, digital broadcast signals are less susceptible to interference and are more efficient. What's more, radio airwaves can carry large volumes of digital information that consumers could one day access over traditional radios or handheld computing devices.

Among the issues the FCC wants to evaluate is the compatibility of new digital radio systems with existing analog service. The commission also wants to look into the affordability of new radios that consumers will have to buy to get the digital signal.

The FCC is seeking input on the best ways of introducing digital radio to the public. Under one method, broadcasters would be able to transmit digitally encoded music or data at the same time as they send out regular AM or FM service.

That means traditional radios would not become obsolete right away; they would continue to receive stations even as listeners begin replacing them with digital models. It also would mean that existing frequencies could be used to accommodate both digital and analog signals.

Several companies that are already testing technology to do just that hope consumers will benefit from CD-quality sound from their FM stations and less interference from their AM stations within 18 months.

Suren Pai, president of Lucent Digital Radio, said the FCC's proposal falls in line with priorities already established by the company. "This gives us a very clear framework in which to focus our efforts," Pai said.

Robert Struble, president of USA Digital Radio, characterized the FCC proposal as "the very important and logical next step in the process."

The public can comment on the FCC proposal until late January. Companies plan to submit data of their tests to show that they can offer digital radio without disrupting existing analog service.

The commission also is leaving open the door for digital radio models that would resemble the way digital television is now offered. Under that system, new spectrum on different frequency bands would be allocated specifically for digital radio, rather than squeezing them into the existing spectrum.

But WHY? There is no logical reason for it except that the ARRL (a body notoriously controlled by hams even tho anyone who is into radio is welcome to join) pushed for a limit to long distance CB comms when 11 meters was taken from hams to make them feel better. After all, from what I've heard on the air, and read in the news group, there is no other band quite like 11 meters when it comes to daily band openings. Hams were bitter and angry about losing one of thier best DX bands so the ARRL pushed for a limit on CBers to pacify them. I admit that this is a bit of a reach however there is no other even remotely logical reason for such a limit.

Hi Craig most radios with three wires have the orange wire for memory usually a fuse of 1/2 amp will do and this wire will have to stay hot all the time to retain that memory. The red wire most of the time is for power and is usually connected to the ignition so that when you turn off the key to your car the radio will go off. Most of the time that red wire has a 2 1/2 amp fuse. I am a ham AB5KR but and here is the but I own a CB Shop in McKinney Texas. 73. Larry.

He cannot get a license to talk on 27.555. That frequency, and the
ones around it, belong to another radio service that is not hobby in nature.

I thought a Maxon was a commercial radio that can be programmed for the right channels if it was designed for the specific band you were going to use.
http://www.maxonusa.com/prof.htm
I think you had better have a look at the maxon product range before you pass up a opportunity to buy one of these radios for such a low price.

Gets mighty expensive if you can't pass the code. As for the rule change
petition, this is the only change I would support. Freeband should
remain illegal.

How is getting a ham ticket going to help him talk legally to people
on 27.555? This is what he is trying to accomplish.

Becuase he's trying to talk on 27.555. A ham ticket will not help him
in this regard.

it is most definetly not published anywhere on the internet due to all the members world wide that would be in jepordy. if the station you work wants to qsl they will give you there address over the air. its considered rude to send one with out asking permission on the air.

> could you email to myself an url , a link or the file itself with
>the 1999 AlfaTango's Call Book.

Looking for advice on a good mobile for my rig. Has to have am,fm,ssb (10 meters or HF). I already have a yeasu 840 for my base station but this sucks for am operation. Need a good talking mobile on am as well as the rest. thought about the galaxy DX-99V but don't know much about this one. any suggestions would be appreciated. Also has to be simple to mod for 11 meters.

Forgive me for being skeptical and/or naive, but can you
provide some specifics other than vague references to
underhanded dealings concerning global communications
by the Feds?

<>

Again, forgive me for pressing the small matter of details, but
can you mention specifically what cash is flowing as a result of
Riley Hollingsworth's amateur radio enforcement efforts?
Amounts? From whom? And to whom?

<>>

Maybe you can help me here. Of all the published remarks
made by Mr. Hollingsworth, I cannot find any mention of his
intention to streamline or reorganize anything. I do see where
his stated goal is to assist in cleaning up ham radio, and in
another recent statement he promised to look into 10 meter
incursions by unlicensed stations and sale of type-unaccepted
equipment.

<<>>

What you say sounds very impressive. I'm sure there is a good
reason that you provide no specifics regardig either your identity
or the role that you played in our government.

<>>

A sampling of the interviews you refer to, published here,
would really help deliver my wake up call.

<>

Sounds ominous. Er, just a few things I need cleared up here:

* who is it that we think is in charge and isn't?
* what is it that we think will take place that won't?
* what current bill is it that you are referring to?

<< No, your messiah is a false god. What will likely take place
SOMETIME in the future, is that local municipalities will be given the
jurisdiction of enforcing their own areas. But this is old news. Like I

said, you are free to believe what you like and no one will think ill of you for it. But these are the facts. It is my profession and my passion to educate the public.(I am a writer) Especially when it comes to Big Brothers Bull. There are many avenues for you to obtain the true information on what is truly taking place. >>

Can you provide a bibliography of your published work? I'd like to catch up on what I've been missing all these years.

<>

Maybe I missed it, but it's unclear who specifically you feel claims to hold the reins of power at the FCC and who really holds them.

First off, it sounds like you live in a noisy area so short of moving, there's not much ya' can do about it. Your street is probably one that uses mercury vapor street lamps. These are really bad for noise and it isn't the fault of your antenna. What does kill the noise is a good radio. More specifically, one with a good Noise Blanker. A noise blanker is different from an Automatic Noise Limiter. In fact, it is superior. A noise blanker will insert periods of silence in your receive signal when it detects impulse type noise. An automatic noise limiter will limit the amplitude of the noise that gets into your radio, but there will still be noise. The best bet is to use a radio that has both an ANL and a NB. The Grant XL is such a radio.

If you want reliable, short range communications, FRS is the only way to fly.
You would probably get more range on the CB during ideal conditions, but the radio is far less convenient and reliable. Ideal conditions, for short range communications, have not existed on my CB until this evening. The last 5 weeks have been very very noisy. Mind you, I had no problem talking from this continent over to several countries in Europe.... :->

compairing apples to oranges again?
what you say about robbery and getting involved should go without saying but understand, not all out-banders and people who run power on the "legal" 40 always run mega-watt stations or always disturb their neighbors or others on the channel. there are a few of us who really take others into account on these matters.
the question i asked a few months ago remains unanswered, "who appointed the hams as the defenders of the spectrum?"
if an unlicensed person makes an incursion into ham airspace, shoot him down.
if you, personally, or someone you know has an interferance problem with a splatter box station, hunt him down like the dog that he is.
if you live in seattle and i'm in fla talking 100 watts on a harmonic clean station on the out-bands and not riding a harmonic into 10 meters, leave me alone for this IS none of your business. if you hear me on the out-bands, either you are hopeing to hear dead air and am upset to hear a voice or you have alterior motives for being there yourself but that couldn't be because you sound like someone who would NEVER break the rules.
if hams arn't supposed to be on the out-bands, why are they even aware that we are there and why are they bitching about us being there?
unless someone has another explaination, it seems that they bitch about a band that doesn't concern them just for the sake of bitching.

get off the gossip fence and go do the laundry, old women.

: it help you to hear people from farther away too?
: Thanks alot,
: Andy Bloomquist

Hi Andy,

An amplifer for the transmiter side of a CB is not legal, but people have
them and use them often. On a standard CB radio a distant station will
increase your S-meter reading of his signal 1/2 unit for every doubling of
power he does.
Receive preamps are very legal, but hard to use in big cities where
the noise is too much. Most amplifiers for CB include a preamp for receive
and some increase in power going out.

it's probably cold war paranoia that keeps cheap international cb
communications out of the hands of every day people like us.
but that doesn't make sense. i could go to key west and talk to castro and
still be under the 150 mile limit but i think there's something in there about
international comms isn't there?
even then, i could be talking to a local friend with coded sentences that sound
like innocent conversation and still be over heard by castro's henchmen. OOOH,
that's scarey isn't it? :):):)

Source record: 9690

Someone else gave you the link to your Cobra's mic socket. As for the Mura......armed with a continuity checker you should be able to figure out the microphone without tearing it apart. The leads are most likely....

Tx Audio
Mic Gnd
GND
PTT
Rx

Check all pins to find two that register continuity. Key the microphone and find the other two that measure continuity. You'll find that one of these pins is common. This will be your GND. The PTT line goes to ground when you press the PTT button. When you release the button, it pulls the Rx line to ground. Some radios need the Rx line pulled to ground before the receiver is active, but some don't.

To find the Mic output, turn your meter to AC volts on its lowest range. Key the microphone and whistle into it until you measure a voltage on two of the pins - make sure you turn the volume control on the microphone up full bore first. If it is a pre-amplified mic, which yours is, you should measure about 60mV, maybe a little more. A stock, or unamplified, microphone will generate about 30mV - sometimes less, sometimes more if it is a Shure unit. Keep in mind these are low voltages: 30mV = 0.03V

On some (many) microphones, there is only one GND lead and it is common to the microphone element and the Tx/Rx switch. However, this isn't normally the case with preamplified microphones. It is sometimes impossible to determine which one of the two microphone pins is the shield and the hot lead with a hand-held meter. If you connect your radio up and it starts squealing like a pig, you probably have them reversed!

Hope this isn't too technical.

Seems like if you had any truth to speak you would post it under your real email address. False address for not so true stories. The Davemade guys seem to think that when you sell their products, you should sell only their product, (WRONG). Concrete and I were keeping the promises going through email, but the promises never would materialize. Seems to me that this has always been a typical problem as many others have spoke about the same. When something goes wrong, the team Davemade has to send email and make phone calls to get their buddies envolved to cover their butts so they don't look so bad. No one brings this on themselves, except for the team called Davemade. Concrete, come to Memphis and we can finish our email there session there. I'll bring the laptop. Quit crying and start doing the right thing, Produce what I will say is a good product and quit trying to be selfish.

I didn't notice it until the early 1980's myself. I know the FCC has cracked down on the higher-power operators periodically over the years. I would guess that a "keydown" would be akin to shottin' ducks in a barrel for the FCC. But I must confess the mudduck crowd doesn't bother me. I can't say I've missed a chance for a qso cuz of mudducks. I can't say the same is true of some of the banditos south of the border though. I had a contact into south africa washed out today by some spanish speaking yahoo with an echo mic and a love of his own voice. Just keep in mind - its only a hobby!!!!!!

>> Why? Why can't the ITU and the FCC change the regulations for 11 meters?

>Neither has ever and will ever be in favor of having world wide bands...

where have you gotten your information from?
sounds like wishfool thinking to me unless you have an inside line to the heads of the fcc and the itu. i wouldn't make such sweeping sentiments if i were you lest you start sounding like the other rf police who post inaccurate attempts at intimidation.

>used by people unwilling to learn a few simple rules and principles as
>well as operating procedures.

believe it or not, there are some of us who have read the rule book and have the technical background to be a ham but choose, repeat, CHOOSE not to for what ever reason.
the only difference between you and me might only be a piece of paper and the frequencys that we choose to communicate on.

>
>Many countries don't share our CB band and many DX stations on CB don't
>speak english like most do on the ham bands.You may also want a better
>antenna.

many countries don't subsribe nor are subject to the itu treaties and many countries that i've had contact with DO have english speaking operators.
it would be kind of stupid to call cq, dx to someone if you don't speak their language.
the way you're talking, it sounds like a person in Germany automatically knows english when his ticket first hits his hands. there are out-banders in other countries who speak english also.

> Hell, some people might not want to go to 10 meter
>> and work DX's. Some might just want to stay 11 meters.

sounds like me to a tee.

>Why?More priveliges ,modes,power and space,and you can still break the
>rules if thats what your into its just a little harder.
>
i have that now and, as you say, "can still break the rules". i just don't see the need to make my life any harder. you make it sound like hams are a bunch of masochists who have to walk on hot coals to get their ticket. i'll bet you're in charge of recruting for the ARRL, arn't you?
i love the banter.

Gawd, <memories :-)> I remember the good old 13-883.

When I was a kid, our family had one in the car (around
1975-76). Quite a good radio - seemed to be more
sensitive & selective than the old 13-857 we had that
was stolen. Can't remember if it was a -B submodel or
whatever. I remember listening to it on a receiver -
nice fat full AM sound.

The 13-883 we had was NOT a PLL rig but used a "crystalplex"
method that, if I recall correctly, used only 13 or 14
crystals. So not a lot of self-inflicted background noise/
phase noise/birdies, etc.

-Bill

>Yes it is, Jeff. Getting a license is easy. So easy, in fact, that
>the only explination for your continued illegal activities is that you
>get a kick out of breaking the rules

DIFFERENT JEFF HERE.
this is NOT always true for every cb or out-band dx'er.
for me, i like 11 meters and slightly above hf communications and have no personal need for morse code, packet, fm, satallite or a lot of the other things that come with the tests for a ham ticket.
for me, i like good old ssb or am comms. this is why i would prefer a licensed portion of what is now considered the out-bands for an in between point between cb and ham.
for some of us, all that other static is like cookies in your hard drive taking up a lot of spact that could be used for more useful operations. i've had hams tell me here that they learned the code and forgot it and haden't used it in X number of years just to get on 10 meters. if this is the case, why bother with it at all? even the U.S. navy and coast guard don't monitor cw any more. maybe they know something that the ARRL and the ham community doesn't? HELLO!!!! this stuff about, " i had to learn it, you should too", doesn't cut it any more. if the medical community felt that way, we would still have surgery while still being awake and aware.
i know about the itu and all that dinosaur shit. the itu should be more concerned with high power commerical broadcast than compairativly low power personal communications like cb and ham.

>> My interests are the ability to communicate, PERIOD.
>

my feelings exactly.

>> And I don't want to become an "elite" by taking a
>> test.

the company is better, the air clearer and the shit shallower on the out-bands.

>I know the rules. And thats all I need.
>
keeping this in mind, a piece of paper and the frequencys that we use may be the only difference between us.

> But how do we know that you know the rules?

give us a test and, upon passing such test, allow us a small portion of the requested spectrum to operate on.

> How does your neighbor
>know that you can operate a radio safely without putting his family in

>danger?

get off the shitter and into the real world. we are not asking for mega watt privledges in the microwave band so keep with the program here.

if my neighbor has the brains of a turd, he won't be climbing my push-up pole and hugging my antron for hours on end on a daily basis.
if he's a responsible parent, he won't let his kids do it either.
most, but not all, cb / out-banders use normal elevated antennas and know the higher the better and their yards don't look like a rats nest of wire antennas.
we wouldn't need all of this with the small portion of the requested spectrum.

>That was one reason why the FCC was created, you know?

that's bullshit that stinks out loud.
in 1934, they had no idea what the effects rf fields had on people. the fcc was created to keep the bandwidth which was limited at the time by existing technology from becoming the tangled mess that cb was in the 70's. at least they had enough foresight to see that comming. now the fcc has become a puppet of the ARRL and has become a sleeping giant that has become bogged down by the lilliputions of the ham community and bows to the wishes of said community or risks the wrath of it's ham masters.

>that is one reason that the FCC put such heavy limits on the untested,
>and now unlicensed, CB operator, you know?

not altogeather true.
the essance of what you said was true but the intent is false.
the heavy, albeit, outdated limits were put in place because cb was intended to be an easy, unencumbersom form of local communications for the average person. this is all well and good for the average person. then you have the amateur frequencies for the golden gods. now there is a need for a portion of spectrum for the people who fall in between. before 1978, 27.235, 245, 265 up to 27.405 were considered "the out-bands" and a forbiden zone. the fcc wised up and discovered that we had out grown 23 channels and in 1978, and opened up the other frequencys for public use. this shows that they CAN do it and there is no sane reason that they couldn't do it again.
you might say what will happen in in another 20 years? there's always the 40 below ch 1. and 20 years after that? with all of the technological advances happening every day with data compression and vhf / uhf miniaturization, there will come a time when the ham community will abandon 10 meters altogether because the components used for such an "ultra low" frequency will be too big and bulky for practical use and we will be there for nostalga's sake to fill in the gap on this futuristic view of a yet unused band. by then, neither one of us may be around to argue the point.

>You would not say the same thing about other public activities, Jeff.
>You would not say, for example, that the auto driver does not have to
>have a license

here we go again with the apples to oranges thing again.
in the 44 years that i've been on this planet, i have not once been hit by an un-licensed radio operator nor have i read in CQ, QST, popular communications

or any other publication, for that matter, any one who has. or did i miss the headline that read, "SCHOOL BUS RAMMED BY OUT OF CONTROL GALAXY 949. 20 CHILDREN SENT TO LOCAL HOSPITALS."

>By your argument, all that matters is that he knows
>that he knows the rules.

in case you don't keep up with the news, there are many auto drivers out there who have lost their license for one reason or an other who continue to drive. by the same token, there are many who have never lost their license who still ignore the rules of the road.
help me out here, i've lost track. was this an apple or an orange this time?

> We (the other people on the highway) can only pray that he knows how
>to read the words on the stop sign at the intersection that we are both
>approaching

sad to say, this is not a requirement either.
there are people in this country who either can't read english or can't read at all.
i don't know what state your in but i've heald drivers licences in new york, florida and georgia and ALL of them have a road sign SHAPE test where the person taking the test has to be able to identify the sign by the shape and not the words on it. the ham community needs to come to the realization that not all people walk the goose step that the ARRL would like to see. if i were a ham and became a member, they would get sick of hearing from me in short order about a lot of their policies.
again, apples to oranges.

>We have no right to expect that he take a simple test to
>prove at least some basic knowledge of vehicle operation (and a eye test
>to insure he can even see the stop sign).

i've read this 4 times and still don't get your drift. there ARE such tests and why shouldn't we expect such things?
i think your loop just unlocked.

>And please don't try to claim that your radio operation is not a
>public activity. You're radio waves don't stop in your living room.
>They go out all over the country and can affect hundreds, or even
>thousands, of other people. Those people have a right to expect you to
>take a simple test to prove that you
>at least have a basic knowledge of
>radio operation.

HOLY SHIT, LOOK OUT, HE WENT NUCLEAR!!!!
do you mean to tell me that if i were to get on 27,585 ssb at 100 watts, that i would wake and disrupt the the lives of THOUSANDS of people???
WOW, i didn't know that i was that important. just think of all of the children out there who's lives would be destroyed out there if they heard me say "OH SHIT" blairing out of their mother's microwave oven doors. i don't think i could live with my self. not to mention when i call CQ from florida. if the skip is rolling northwest at the time, all of the pacemakers that would go Y2K

in utah. thank you for saving me from a life of unbarable guilt.

JEFF HERE AGAIN, sorry, i hit the send button too soon.

>Those people have a right to expect you to
>take a simple test to prove that you at least have a basic knowledge of
>radio operation.

help me out here. i've read the constitution twice but i can't remember who
wrote the passage that you've mentioned here.
was it Alexander Hamilton or one of the other framers that wrote it into the
Bill Of Rights? or, maybe i'm wrong. it could have been in the Dead Sea
Scrolls. if you know, please let me know.

all this whole post has added up to is a lot of apples to oranges comparasons,
conjecture and general hype on your part that has done nothing but damage the
small amount of credibility that the ham community has left here.
in the future, please get your shit together, think out what your going to say
and then reasearch it for accuracy.
good night.

Bull. If a person can talk from the US to Australia - and that happens
quite frequently from the Western US - then they can talk to any other
country in the world.

It may not be as easy as on 20 meters, but it is easier than on 10.

I have QSL cards from close to 100 countries from 10 meter CW - and
they were all obtained within one year.

: There are only about 260 countries in the entire world, and he claims
: to have made contacts with nearly half of them. As I said before,
: absolute nonsense.

Not nonsense - but it would require a lot of air time and dedication.

> Or file a petition to relax the rules.

Hams don't want that. They think that taking some stupid test gives them some morale right to talk to anyone they can hear who is willing to talk back and that this right should be denied to anyone who doesn't take thier stupid test.

I challenge the authority of any group who does not answer to congress to be able to make laws that I have to live by. FCC officials are not elected by the people nor do they answer to Congress. They are appointees of the executive branch of our gov't. The FCC has even been used to place taxes on the American People. Taxes that Congress had already failed to pass. So what did the Clinton administration do? They had the FCC apply the tax to our phone bill then forbade the phone companies from itemizing the tax on our phone bills. In fact, the law is that if a citizen asks the phone company why the bill went up they are legally required to lie to us and tell us anything except the truth that the FCC increased the phone bill.

The very existance of the FCC as it exists now is blatantly unconstitutional. Yet, no one with the green stamps or political influence to do anything seems to have the balls to challenge this and other threats to the Constitution.

I'm going to get off my soapbox now b/4 I get really going. The topic of gov't abuse of the Constitution makes my blood preasure rise.

: Boy, I must conceed the discussion to the RF engineers on this NG.
: Espectially you Mr. Lowtower, or perhaps your real name should be inserted
: here. Aparently you guys know much more that both the Diamond and Larson
: Antenna Companies, which presently use Teflon to minimize RF splatter on
: several of the ground elements on some of their antennas. I must say I am
: impressed. All of this wasted talent is being spent on CB.

Maybe it does reduce splatter - but not for the reason that you seem to
think it does. If the Teflon is used to seal the joints between the
sections, then it would reduce corrosion - which CAN lead to harmonics
or splatter.

: PS: I almost forgot! You guys should also let computer board manufacturers
: know about your discovery so they'll stop wasting their time spraying all
: those components as they come off the production line. They'll be very
: unhappy to know that their attempts to reduce all of that stray RF running
: around in a CPU cabinet has been in vain.

No computer board manufacturer, that I know of, sprays their boards with
Teflon - or any other insulator - to reduce stray RF. The insides of the
CABINETS are sometimes sprayed - but with a conductive spray - so that
it can be grounded. It acts as a Faraday cage.

Source record: 9712

Hi when I use a field strength meter usually I place it in a fixed position, say a post or some location that it never moves. then I key the transmitter and ajust the controll to give half of a meter reading. Then I change antenna untill I get one that gives me the most field strength reading. This reading is only relative and has no meaning except that you can see that the field is greater or less. All I ever connect to my field strength meter is a small antenna usually no more than 6 inches long. I have walked around my car with the meter to see where the most field is coming off. Some times I use it to see if a walkie talkie is transmitting. And if I just want to see if a box is putting out something I can tell a big differance in the movement of the meter. I hope this helps Larry AB5KR

Sounds hallucinatory to me.

<<the heavy, albeit, outdated limits were put in place because cb was intended to be an easy, unencumbersom form of local communications for the average person. this is all well and good for the average person. then you have the amateur frequencies for the golden gods. now there is a need for a portion of spectrum for the people who fall in between. before 1978, 27.235, 245, 265 up to 27.405 were considered "the out-bands" and a forbiden zone. the fcc wised up and discovered that we had out grown 23 channels and in 1978, and opened up the other frequencys for public use. this shows that they CAN do it and there is no sane reason that they couldn't do it again. you might say what will happen in in another 20 years? there's always the 40 below ch 1. and 20 years after that? with all of the technological advances happening every day with data compression and vhf / uhf miniaturization, there will come a time when the ham community will abandon 10 meters altogether because the components used for such an "ultra low" frequency will be too big
and bulky for practical use and we will be there for nostalga's sake to fill in the gap on this futuristic view of a yet unused band. by then, neither one of us may be around to argue the point.>>

Are saying that if one wants a frequency, you should just
start using it, and eventually whoever it is allocated to will
have to give it up?

Reminds me of the famous novel, LORD OF THE FLIES where a
group of schoolboys were shipwrecked on an island without
adult supervision.

I think it is a good radio. The noise level is so high that it makes it hard to talk on a regular cb let alone a hand held. This high noise level is caused by the Sun. We are in the middle of solar cycle #23. To prove my point try getting up before the sun comes up and using your hand held. You should have a lot more luck talking talking to someone. And just for the fun of it if you hear stations comming in during the day from far away places try to talk to them, it could happen that your signal will skip back to them. I have talked to Canada on 2 watts or less and I am in Texas. Have Fun With Radio Larry AB5KR

.>that the overgeneralized
>stereotype would have us believe.

we didn't over generalize or stereotype anything. the hams who act like the airway patrol have demonstrated this to us here beyond a reasonable doubt.

>So, in your mind then, a person who acts "human" is one that disobeys
>the common rules of society

the fcc rules are NOT common rules of society as not all of society operates a transmitter. these rules only govern only a small portion of society. don't try to include cell phone users in this as they are exempt from the rules governing foul language and "good operating practices".
rules / laws against murder, rape, arson ARE common rules of society. so please don't STEREOTYPE us with these henious crimes or un-licensed automobile drivers. contrary to the ARRL's belief, there really IS a difference between apples and oranges.

>You tell me. You guys are so great at stereotyping and generalizing ham
>radio and the people that are on it, you should have a fair idea of how
>a "CBer" acts.

we know all too well how hams act. they have proved themselves here on this news group with flying colors. this is the very reason why we ARE cb'ers and NOT hams. our noses are not so long that we can afford the extra lenght to stick it in other peoples asses or business where it is neither needed nor wanted.

I've had the Sidewinder for a few days now and after a call to Copper and some tinkering, I'll be keeping it. My first posting was a little harsh. It's actually a nice little radio with AM/FM/SSB 400 channels plus another 800 if you count the +5 and -5 kHz switch for a total of 1200 frequencies. At $96.00 thats a real bargain!!!!!!

>Ah, now we are getting somewhere. You finally admit that hams who use
>CB equipment have a right to discuss CB related topics in this
>newsgroup.

i never denied this. we all know that hams NEVER stray outside of their assigned bands except to be on the legal 40.
if they want to come here and, key word comming up here, DISCUSS cb related topics, they are more than welcome.
it's when they come here like the clay-footed gods that they act like and try to shove their holier than thou attitudes down our throats, this is when i puke it back at them because it really doesn't sit well and doesn't stay with me very long. i don't care if they express their views against power or the out-bands. they have this right. it's when they all crowd in here with the attitude of an fcc inspector or an rf cop that gets them into trouble. they have a right to report their complaints to the fcc just like any other citizen. they do NOT have the right to come in here like gang busters on a raid and push everyone here into the paddy wagon.

>And you claim that we have no right to discuss out-of-band
>issues because it does not have anything to do with CB or Ham radio.

you DO have a right to, here comes that key word again, DISCUSS out-band issues. but if you, as a ham, can't go into the out-bands and we, as cb'ers, are willing to suffer the consequences for doing so. WHAT IS YOUR BITCH ABOUT? the only thing i can see is jealousy.
in some states, oral sex is out-lawed, even between husband and a consenting wife.
if you were to pull my curtains aside and see us in our bedroom and report us. aside from getting your face shot off, would what goes on in my bedroom be your business?
NO, you have no business in my bedroom and what goes on there was doing no harm to you or the good of society.
same for the out-bands. if you don't go there, and we arn't interfering with your bands, no, it's none of your collective business.

>So, what in the heck are you doing here, Jeff? This newsgroup is for
>discussions about CB radio. This newsgroup is called "rec.radio.cb,"
>not "rec.radio.freeband" or "rec.radio.out-of-band."
>
then you better tell at least 50% of everyone else here. i didn't start the free band discussion. i only joined in. where would you rather we go to DISCUSS the out-bands, rec.radio.amateur???
works for me, see you there if you ever go there.

> And you claim that we have no right to discuss out-of-band
>issues because it does not have anything to do with CB or Ham radio.

if you want the right to DISCUSS "out-of-band" issues, then you must be in the wrong place too. after all, it stands to reason in your paragraph above that YOU TOO want this right so dump the horse shit rightious attitude. it makes you look like an idiot.

> You are the one who does not belong here. By your own admission, your
>discussions about "freeband" activities, or "out-of-band" activities,
>does not relate to the topic of this newsgroup.

by my own admission where? it seems that the "uppers and lowers" reside much closer in the relm of cb than ham. you're the ones that stumbled around in the dark and woke the sleeping dragon here. your display, here, looks like a veiled attempt to run the cb'ers / out-banders and take over this news group or at least install a ham as a seudo-moderator. nice try but no cigar as your logic is so flawed your loop won't even lock.

Hi here is a very simple direction finding antenna for CB radio. Take a peice of 1/2 inch soft copper tubing 48 inches long and bend it into a circle. do not connect the ends but put a screw into both ends. Take a small lenth of coax with a connecter at one end strip the other end so that you have the shield wire and the center conductor seperate. Wrap the center wire onto the screw of one end of the loop and shield wire of the coax around the other screw on the other end of the loop. attach a broom handle across the loop and use this to turn the loop. Connect the coax to a CB that has a signal meter . You should see an increase in signal when you point the loop side that has the center conductor connected to it at the station. >

they have given these freqs up long ago. yes, they are still assigned but go unused. most of them are assigned as broadcast links below ch.1. how many news trucks do you see running around with 9 foot whips as their only transmitter antenna?
the ones above are mostly assigned for ittinerant businesses. today, a vhf / uhf business band radio system is easier to obtain than a 27.530 transmitter unless ofcourse they shop at antique shops and yard sales.
for these services, this is dead, wasted air that's cleaner and clearer than cb.
it's like the rancher that owns a ranch the size of new jersey and only owns 3 head of cattle. would he miss anything if a comparitivly few people stopped and took a drink from his rageing, mile wide river?
it may not be right but if he never looked, he'd never miss it except for the few assholes who try to dam and divert the river. (analogy to the mega watt splatter stations) if this were the case, i'd stand next to the rancher and shoot at the encroachers with him.

I do belive you are correct in your input of the line being changed to the more modern
and faster proccessor but stand corrected it is still available from resellers for 1100 to 1300 last I looked into it back in july. Toshiba laps fairly suck and dont have much resale value. I am not saying Compac is a Dell or a Powerbook but much better than
a Toshiba. Yes it does have a stock 33.6 modem plus a us robotics 56k and 128 meg ram with a 2.1 gig hard drive. The only reason I bought it from Costco is I am
a Regional Manager for Blockbuster Ent. and because of an agreement I get a 15% discount at there. Oh and by the way I could easily sell this laptop on the market for 800-1000. Ebay trading is for Idiots like you.
Have a nice day......]

I also have this laptop and it is a very good performer with win 98 if you have at least 32 meg ram. I have used and abused mine and it seems to be bulletproof.
I do however think he is high on what he thinks he can get for it cash wise. I belive I just saw one sold for 700. Still for a trade for a base it is a great deal. very upgradeable.

my two cents outttttttttt/
roy.

Okay, Green. I'm going to assume that you're serious and want a serious answer. The United States does not live in a vaccumm. There are hundreds of other countries out there. When it comes to radio waves, which do not stop at borders, it was immediately obvious that some international aggreements had to be made.

One of those agreements specified areas of the radio for international hobby use, and set the limits of the use of those frequencies. This was to insure that there was plenty of room for hobby use, but that hobby operators would not interfere with other radio users on other frequencies.

The FCC decided to create a new radio service (CB) that would allow business and home users to operate equipment without a complicated license process. To insure that it did not conflict with the international aggreements that the States had already committed to, there were serious restrictions placed on it.

For example, to insure that the signals from CB did not interfere with the radio transmissions of other countries, they limited the wattage, the height of antennas, and demanded that CB operators refrain from attempts at long-range communications (the 150 mile limit). It was only thru the addition of these three limits that CB could be created without messing up existing international aggreements.

Remember, the FCC did not really see these as unreasonable limits (and still does not to this day). If you wanted more, there were other radio services that could provide that. If you wanted better business communications, there were the dedicated business radio bands. if you wanted better hobby communications, there were the dedicated Amateur Radio bands.

The Amateur Radio band was created by international agreement. The bands and frequencies are fairly consistent world-wide. Therefore,

there is little chance that a person using these frequencies would cause problems for other radio services in other countries.

That same standard does not exist CB. A person operating a CB illegally in the US, by using excess power for example, has no idea if he is interfereing with another radio service in another country. For that matter, he has no idea if he is interfereing with another CB operator in another state or perhaps even in the next county.

The limitation on serves a serious purpose and is reasonable. If you want more, consider your other options.

That's not what you said before, Jeff. You said that American Hams suck. Since the Hams in your town are also Americans, then obviously you included them in your assessment. Again, did you tell them that they suck, or are you just saving your negative opinion only for this newsgroup? Or perhaps you're just saving that opinion for people who disagree with you?

Better read your constitution again, Green. The President is elected
by the people. Article II of the Constitution gives the President
executive power (the president is given this power, not congress). In
other words, the President is in charge of the entire executive branch
of our government, except where otherwise provided for in the constitution.

Article II, section 2, gives the President legal authority to create
executive departments to assist him with the adminstrative aspects of
government, and to appoint the heads of those various departments. The
FCC clearly falls under the executive authority of the President, and is
therefore completely constitutional.

me either, i think the rf police should just knock off their bullshit, stop wrecking the harmony that we CB'ERS could have here and stop feeding like leaches off the blood of the misery that they cause here. instead of comming by and picking the scabbs of the wounds that they cause. it would be nice if they would just let them heal, check their rf police badges at the door, respond to the CB RELATED posts that they like and ignore the ones that they don't instead of dumping more spam than hormell could make in a year on them and pretend to be professional in their demenor like an elmer to guide rather than a false god who looks like an asshole to everyone but himself.

OH, WAIT A MINUTE!!! WHAT TIME IS IT??? 4:20 AM!!! I MUST HAVE DOZED OFF. WOW, WHAT A DREAM!!! I DREAMPT THAT I HAD MISUNDERSTOOD SOMETHING THAT AN RF COP WROTE.
GEES, I THOUGHT, FOR A MOMENT THAT HE MIGHT HAVE AGREED WITH ME ON SOMETHING.
OH WELL, BACK TO THE NIGHTMARE.

You've heard the reasons over and over, Green. There is no reason to keep repeating them, since it is obvious that you don't want to agree with those reasons. Instead, you choose to dismiss the given reasons and then demand more.

I think the given reasons are valid. More importantly, the FCC thinks the given reasons are valid. If you want to change our minds, it is up to you to establish that they are not.

You're the one going around claiming that hams have no business
posting to this newsgroup. If we did say that you couldn't post to the
ham newsgroups, we would only be applying your own standards there.

However, that is not what I said, Jeff. Please stop trying to twist
my words. I was not telling you that you could, or could not, do
anything. I was simply stating that you, as a CB'er without a ham
license, would have little reason to post anything in the ham radio
newsgroups. If you want to read more into that then there is, then you
have a very vivid imagination.

> the hams were doing a lot of sand bagging a couple of months ago to shore up
> the flood of flames that came their way for comming here like gang busters and
> ordering people around.

I was not even posting to this newsgroup a couple of months ago, so
why are you hassling me? If you have a problem with the people who were
posting here a couple of months ago, you need to talk to the people who
were here a couple of months ago.

However, I seriously doubt they were "ordering people around." You
claimed that I was telling you what to do with my simple statement above
- perhaps that is what they were doing and you just twisted their words also.

Breaking the law is breaking the law, Jeff. You're trying to claim
that your law violation are less than another law violation, but it is
still a violation of the law.

> the question i asked a few months ago
> remains unanswered, "who appointed the
> hams as the defenders of the spectrum?"

The FCC did, Jeff. One major aspect of Amateur Radio is the
self-policing of our own frequencies. The FCC has repeatedly said that
they expect that.

> if you live in seattle and i'm in fla talking 100 watts on a harmonic clean

If you didn't go around bragging about your illegal activities in this
newsgroup, we would not even know you were there, Jeff. We know you are
there because you told us - right here in this newsgroup.

And, once you make statements in this newsgroup, other CB'ers have a
right to comment on those statements. That includes the CB'ers who also
hold a ham license.

Look Jeff, I'm not going to sit here in a tit to tat argument over
each little aspect of this issue. I simply don't have the time.

The simple fact is that the CB band is not going to be expanded.
According to the FCC, there is simply no ligitimate reason to do so.
And I fully agree.

If you want AM/SSB communications with greater range, get a ham
license. Then you can use the 12 meter, 15 meter, 17 meter, 20 meter,
30 meter, 40 meter, 80 meter, and 160 meter, ham bands. All of these
have far greater propagation properties than the 11 meter band.

If you want more reliable local communications, with occasional skip
conditions, then try the 6 meter, 2 meter, 1.25 meter, 70 centimeter,
and other, ham bands.

The CB band was created to provide local communications for people
with absolutely no radio or electronics skills. The limits exist for
those people. Removing those limits would place those people in
potential danger (few in CB know how to safely operate a linear, for
example). It would also subject the other radio services to potential
interference (few in CB know how to properly operate a linear or
modified radio).

If you think your skills are more advanced than that, again get a
license to prove it. And then operate on the legal frequencies that
have been set aside for more advanced radio hobby use.

Same here.

12 years and you can apply for Adverse Possession and then Full Title to
a property.

A couple recently sold a property for 200K+ USD which they had
'acquired' for nada, zilch, 12 years before.

The American people make the laws through our elected representatives, Jeff. There are many laws that are not specifically mentioned in the constitution. For example, the constitution does not establish murder or rape as violations of the law, but few people in this country would doubt that they are ligitimate laws.

I have already discussed this in another message, so I'll only cover is again quickly. The constitution puts the elected president in charge of the executive powers in this country.

The president has the power to appoint department heads that set rules having to do with the adminstrative aspects of this country. The FCC was established to administer radio use.

The FCC ruled that a person should be required to take a test to prove that he has a basic knowledge of radio operation prior to operating more advanced radio equipment.

If you don't like that rule, elect a new president and have him appoint someone over the FCC that will change that it. Since, in my opinion, most Americans would agree with that rule (and few would agree with you), you have very little chance of finding a president who would be willing to change it.

Cross-posted to: rec.radio.swap,rec.radio.cb,rec.radio.amateur.equipment

I have seven (5) Panasonic WV-1414 CCTV cameras with lenses all in fine working condition that I would like to trade for some type of ham gear. A picture of one of the cameras can be seen at:

http://www.usol.com/~tje/pancam1.jpg

They require 24 VAC power. I can also provide power transformers for them if needed and the right deal comes along. These cameras are used but in great operating condition. Please email me with what you have to trade. PLEASE NO converted commercial vhf/uhf stuff.

>Probably you are one of the many operators that start any QSO by
>asking for having coordination instead of enjoying a very relaxed QSO

if you were to look at my signature youll notice a link to the real Kp dx group from the USA. anybody thats experienced on the freebands will know that the Kp(usa) group is not comprised of qsl card hunters but only expereinced people wanting to make friends and not a large qsl collection, although last cycle when i was sort of new on the band i did do very well collecting cards but the proliferation of qsl managers and SES stations has gotten out of hand so ive stopped with all that. you wrote something to me in a private mail about being anonymous but i sign with my callsign, i dont see yours anywhere. if you need a address i suggest you subscribe to wwdx like others and ask for it there or find somebody else to send you a email with the directory attached. ive helped a lot of people find address here but i wont with you.

>If the station I have worked for any reason (QSB, QRM or ball-breaker
>on the air) did'nt pass his coordination, I feel in the right to
>retrieve his coordination in a different manner.

plain and simple, if the station you worked gave the OK to send a qsl then its fine. if not then its not OK. just because you speak with somebody doesnt give you the right to send a qsl without permission, no matter how friendly or long your qso was. i can tell your not too long on 11 meters because you asked for a url with the AT callbook. anybody on 11 for a long time would know that the info is kept confidential to protect the identity of the members worldwide since there are over 5 thousand and they are all freebanders. have a good day and good luck getting the diectory from somebody else. 73 tim ex2-AT-436

Not power lost, but rather power reflected. It will be sent back toward the
antenna with some percentage lost in the transmission line depending on the
type of transmission line, length and SWR.

I would do it

1
3
2
4

I bet he has a old Mobile linear with horrendous input matching problems and
would benefit from using the antenna tuner to tune the radio/Amp :)

Elmering. What a nice concept. Unfortunately, sometimes when you "lead",
you have to tug a little bit to pull the "elmeree" in the right
direction. Hams, are not going to encourage lawless operation. The first
step in the "elmering" process, is to show the person, the error of
their ways and to steer them down an equally fufilling (but legal) path.
Along the way, there will be technical challenges to overcome, and
that's where elmering really shines. The sharing of technical knowlege.

But if you view each and every attempt to guide and elmer the legal way
as an affront to your "right" to do as you please, without due regard
for other people, then you'll never get anywhere, and your sour attitude
will remain.

I guess this means that you can't pass the test. The majority of people who complain about the ham test are the people that can't pass it. And then they want everyone else to change the rules to suit THEM. Sorry, this is America, the land of opportunity. If you want something, you WORK for it.

What is the intrinsic value of something, when you don't have to work for it? If you work for something, you tend to take better care of it, and respect it better. How good do you think the ham bands would be if they let just anyone on without any test? Right, about as good as the CB band is now. No thanks......

You also have no concept of responsibility. That license that you so readily discredit, is a ticket that says that you understand (at least) the basic priciples of radio and are competent to operate a potentially high powered station, and understand the repercussions and responsibilities that this entails. This is a situation that could get you KILLED if you do not follow the proper precautions. There is also radiational hazards that need to be addressed, particularly if you run high power and high frequencies. It's a lot more involved than just buying a radio, slapping an antenna on the roof, and calling DX. But since you won't take the test (and learn the material) you'll never know this. Remain ignorant and happy, and spray your antenna with teflon, and all will be well....

You sound like that guy who keeps claiming that the IRS is
unconstitutional, yet it's still here. Maybe if you'd redirect your
energies into learning the system, instead of fighting it, you'll get
along alot better in the end.

> The very existance of the FCC as it exists now is blatantly
> unconstitutional. Yet, no one with the green stamps or political
> influence to do anything seems to have the balls to challenge this and

Maybe because the people that count, know and understand the service
that the FCC provides, and are willing to live by the rules.

>
> I'm going to get off my soapbox now b/4 I get really going. The topic
> of gov't abuse of the Constitution makes my blood preasure rise.

Many people cite the constitution as the grounds for their perceived
injustices. In most cases, these same people really do not understand
the constitution well at all. The constitution allows for the government
to appoint agencies to assist in regulating commerce.

One word. RESPONSIBILITY.

Maybe you think that the whole RF spectrum should be available to anyone that wants to use it? Throw all the rules out the window.

You remind me of one of those "BBS anarchists" that I used to run across when BBSing was the "in" thing with computers 10 years ago. They'd speak out against any and all authority, without the slightest clue of the repurcussions. Spoiled childhood.....

You really ought to seek proffessional help for this "persecution"
complex that you seem to be demonstrating all too regularly.

Hams are not out to "get you" or anyone else. You really need to stop
blaming other people for your problems. The CB band is in the mess that
it's in because of the people that use it, not due to any action by hams
or any other government conspiracy.

What relevance is the frequency? It could just as easily be 28.555.
There is no technical difference.

You really need to get a grip on REALITY Jeff. The reason that many of us say "Fat chance", does not mean that we don't approve of it, but rather, that we understand the governmental and regulatory processes, and how they work, and what's involved. Because we have an opinion that differs from your, does not make us "god wannabees".

In order to create a new "Communicator" band, there would first have to be a formal petition filed. In the petition, you have to have a justifiable REASON for the proposed rulemaking. The type of service that you're proposing is already served by the ham radio service, so in the FCC's eyes, there is not a sufficient reason to create a seperate, but similar service. There is also the ITU to consider, and THEIR rules would have to change before the FCC could change theirs. Now unless you've been living in a cave for the last 25 years, you know that the CB and adjacent frequencies, are not at the top of the FCC's consideration list. CBers have, as a rule demonstrated a lack of cooperation and willingness to follow the rules of radio communication. Why would the FCC create a new band, with say, a 100 watt limit, and an associated set of rules, that these same people will break, just like part 95, when it suits them? You guys really dug your own hole here, so don't act surprised when the FCC does not come running when YOU need THEM.

THAT is reality. You can believe it, or make up any number of "persecution" scenarios to cover it, it matters not to me. There really are gov't agents hiding in your closet. Really.

>

Another conspiracy theorist. Am I starting to see a pattern here?

There is virtually no difference between DX conditions on 11 meters and 10 meters. There's only a 1 Mhz difference, how much different could it be?

Hams were only upset at losing 11 meters, soley because they felt at the time that the FCC was "punishing" them for whatever reason.

The 11 meter band was not that desirable for hams. There were assignments in the band for industial, scientific and medical devices, that caused a considerable amount of interference. Hams much prefered the 10 meter band to the relatively small chunk of 11 meters that they HAD.

There is NO jealosy. Only a delusional mind would think that someone who worked hard for their privileges, would envy someone with no drive to learn or the accountability to follow their assigned rules.

I started out over 30 years ago on CB. Had a blast as a smart-assed teenager, who thumbed his nose at "the establishment" (leftover 60's influences). Met many wonderful people, and it was just great. But the

band has deteriorated. The great people have been replaced by more smart-assed teenagers, and others that are still acting like teenagers, who think that the more 4 letter words that they include in their vocubulary, the more important they feel. Or the ones that think that causing someone else difficulty, is their idea of fun.

This is what pushed me into taking the ham test. It may be true that some hams are "stuffy", or a bit conceited. But I'll take that over a mindless idiot swearing, playing music, and throwing carriers, all night long. I LIKE communicating. I don't like social deviates, and that is what I find on the majority of the CB channels these days.

No, the ITU regulations apply to ALL high power HF services, not just
Ham radio. For the reasons that you correctly applied as well, to
prevent interference to other services that utilized CW. While I agree
that CW is outdated, when the rules were established, it wasn't. But
like so many other laws, it's still on the books.

Why? Will my oil fired furnace suddenly stop running? My electric company has tested all of their "critical" systems, and they all function correctly under a simulated Y2K date change.

The only potential trouble spot will be in the accounting and finacial markets that use date sensitive computers. Most other computer functions are not date sensitive. The micro controller in your VCR, Microwave, car, ham radio, etc, do not even know what the date is. There will be not REAL problems. As long as you have your finacial records (as a precaution), you have nothing to worry about.

Channel 11 was the designated "call" channel back in the early days. 11
did seem to have a much higher acivity level, when the skip rolled.
That's one of the reasons that we moved off of 11 1n 1975 down to the
freshly vacated (When the truckers all moved to 19) channel 10.

So much for YOUR customers.

This attitude prevails throughout a LOT of businesses and industries that have a significant hobby component. What makes it worse is that nowadays, so many products ave been consumerized and commoditized that it is almost always cheaper to replace something than to repair it.

And for most products, the equal-cost replacement is 10 times better than the old repaired thing.

There needs to be a way to get customers to understand what their sentimental attachment to a thing is worth. I sure do miss my old Invader 2000....replacing it today would cost about what it sold for new in 1961, five times what I paid for it in 1987.

Like...put a dollar sign in front of the PEP input.

If you own a shop -- what about "uypgrading" for your customers, and offering a trade-in on their broken old junk toward the purchase of new junk that'll break even sooner? At least you'd move some boxes.

How many of which had mismatches between the radio and amp? Im sure he doesn't have THAT old of an amp........

I would recommend:

1
2
4

Why use an antenna tuner. If you get a decent antenna, you wont have to worry about "fooling" your radio/amp/meter.

Prozac, the alternators you are going to use will just barely run the amp, if you crank the key up you will pull back down to almost battery voltage, I am eager to see you fit these three 250's under the hood of the firebird. Why did you do all of this to a firebird? did all of this equipment you have bought leave you broke? and what kind of bird watts will this swing to when you are finished?
What voltage are you going to run the amp, driver at?

Hmmmm....somehow, I seem to have missed this entire thread and was
rather surprised to find this reply in four different newsgroups to
which I am subscribed. Apparently, my ISP has room for improvement.

KNY2VS is a monitor station registry issued by CRB Research in
Commack, New York on February 6, 1988. I do, in fact, have a ham
license (my call is KC2FNG), but for me, amateur radio is not the
alpha and the omega of my involvement in the radio hobby as is the
case with some people. There are hams who are hams only, there are
other hams who happen to enjoy SWL'ing and scanner monitoring and so
forth. Me, I'm into a lot of things - CB, SWL, Scanning, AMBC DX'ing,
and ham radio as well.

I was an SWL, CB operator, and registered monitor long before I ever
got a ham ticket. I know of some other guys who are hams who also
happen to be registered monitors. Me...I'm a registered monitor who
also happens to have a ham license.

I do appreciate the favorable comments from those out there who
understand that radio is a multi-faceted hobby and that there are many
different interests within radio for people to enjoy. As for the
people who sounded off about my use of my monitor registry I.D.,
well...I'm not going to waste bandwidth replying to people who
criticize something that they obviously know nothing about. :-)

73 and good DX'ing,
John D. Kasupski

<stewart@amouse.net> wrote:

> Better read your constitution again, Green. The President is elected
>by the people. Article II of the Constitution gives the President
>executive power (the president is given this power, not congress). In
>other words, the President is in charge of the entire executive branch
>of our government, except where otherwise provided for in the constitution.

Actually, Dwight, the FCC was created by an act of Congress, which acted under its Constitutional powers according to Article 1, Section 8 of the Constitution to provide for the general welfare of the United States - in this case by regulating the use of a public natural resource (the RF spectrum).

About a month ago, I posted a lengthy summary of the constitutional issues and cited several instances of case law where the federal courts had upheld the constitutionality of FCC regulations. Basically, FCC's authority stems from the Communications Act of 1934, which the courts have of course also found to be constitutional.

We have a lot of people out here on Usenet who apparently have only a partial understanding of how our system of government, and our legal system, works. I've tried educating them in the past, the result has generally been a bunch of nonsensical ranting, obscenities, and flames, so I quit wasting my time...but if anyone cares to find out the truth, they can go back on deja.com and find the exhaustive case law cites and other information I have already posted, which documented quite a bit of information on how the courts have already ruled in FCC's favor in numerous instances. As for those who insist on maintaining that FCC is unconstitutional, I've chosen to let them continue to delude themselves if that is what they wish to do. Those of us who know better, are well aware that the courts have long since ruled otherwise.

> Article II, section 2, gives the President legal authority to create
>executive departments to assist him with the adminstrative aspects of
>government, and to appoint the heads of those various departments. The
>FCC clearly falls under the executive authority of the President, and is
>therefore completely constitutional.

Well, again, Congress created FCC, not a president...currently the President does appoint the five FCC Commissioners, which must then be confirmed by the U.S. Senate as is the case with other presidential appointees to various federal positions.

the ones above are mostly assigned for ittinerant businesses. today, a vhf / uhf business band radio system is easier to obtain than a 27.530 transmitter unless ofcourse they shop at antique shops and yard sales.
for these services, this is dead, wasted air that's cleaner and clearer than cb.
it's like the rancher that owns a ranch the size of new jersey and only owns 3 head of cattle. would he miss anything if a comparitivly few people stopped and took a drink from his rageing, mile wide river?
it may not be right but if he never looked, he'd never miss it except for the few assholes who try to dam and divert the river. (analogy to the mega watt splatter stations) if this were the case, i'd stand next to the rancher and shoot at the encroachers with him.>>>

This part of your philosophy I just don't agree with. CBers were
initially given custody of 23 channels. They failed to self-regulate
their allocation and the band became an anarchy infested by idiots.

Some 'serious CBers' felt justified in moving above channel 23
in order to "escape the idiots" because "23 channels aren't enough",
or so they reasoned.

Luckily for them, the CB boom of the 70's came along, and
the potential revenue seen by manufacturers prompted the
FCC to grant the expansion of CB to 40 channels.

But CBers failed to self-regulate this new expanded allocation.
The same problems arose with anarchy and idiots. This prompted
the 'serious CBers' to again move above channel 40 "in order to
escape the idiots".

So now freebanders ('serious CBers') are petitioning the
FCC to grant another 23 channels (from 27.405 to 28.000) above
channel 40.

What are the chances that, through lack of self-regulation,
these additional channels will also become polluted?

Will you then need to "escape the idiots" by appropriating
additonal RF real estate at 25.000 MHz (or some other
frequency you deem suitable)?

It's like being given a house, trashing it, and then
complaining that it's trashed. And then moving into
the house next door (because no one is using it
right now) until you can get the government to
cede it to you legally.

I believe that if you are given a chunk of RF spectrum and
then you turn it into trash-heap through your own neglect,
you are not justified in crying about it. You are certainly
not justified in moving onto frequencies allocated to other
services "to escape the idiots" - no matter how abandoned
these frequencies seem.

No, the power IS LOST! It's constantly
being converted into heat. If the swr is
3:1, then 25% of the power developed by the
transmitter is NEVER going to be seen coming
from the antenna regardless of how many
"trips" it makes up and down the transmission
line. You are wrong, Bob! If a high swr
is preventing any power from being absorbed
by the load, (antenna) it is lost in the form
of heat.....not to mention the inherent
damage being done to the output (PA)!

Jack

Hold on now, I am not saying anyone is stupid (just extremely lazy).

It is very apparent some people on this board have
no shame. To guess on how something works, making stuff
as you go is crap. I would have never believed the News Group
would be so much (exactly) like it is on the air, where most people
know little or nothing.

There isn't much to say, I agree with you on one point,
most do like it this way. People seem like they would rather
read this board than pick up and read some text-books on
radio and actually learn something (except the
screwdriver experts guide to radio burning)..

Well, I am off to cut my coax to 12' long, make my round
coils flat and spray Teflon on my TV so I don't interfere with it.

Bob.

I appreciate that your comment was intended as irony.

But it does bring up another issue. Many will argue that it is the FCC's job to regulate CB - and that its users have no responsibility whatsoever to aid in this effort - and therefore it is the FCC's fault that 11 meters is continually in need of expansion to help the serious hobbyist "escape the idiots".

I completely disagree with this. In any society, cooperation is the key to an equitable sharing of resources. There simply aren't enough cops in the world to keep the peace if every citizen decided to destroy it. Likewise, no amount of FCC policing can keep CB a usable resource when its users universally ignore regulations intended to help keep it that way.

I must say that Dave Hall hit the proverbial nail on the head several times in his postings. A lack of personal responsibility by its users is the key to CB's troubles.

where are the dead links? The only links there are http://members.aol.com/davemade1, www.galaxyradios.com, www.astatic.com, and rangers site?

Bad spelling? oh well that didn't stop me from getting a diploma as an electronic tech, or an associates as an electronics engineering tech, and in a few weeks I will be finished with me bachelors degree. What kind of education do you have or are you a truck driver? No offense to all truck drivers.

As far as the lack of technical inf. goes I spent close to $60,000.00 for my education why would I want to give it away to you??

First of all! I don't think I'll go broke buying CB stuff but it could happen to you I'll give you my pity!

Second of all The Alernators dont fit and I said that already!

Third i never ran a 32 pill so I would not know what kind of bird watts but I promise to let you know when I read it off my dave made digital bird meter. That X-Force will never be able to copy.

Fourth I have some pretty big lee 8 volt batteries for the 32 pill And the m800 Will be on the 12 volt battery system. Both will be volted to the extrem.

Did Handy Andy actually write this? It is totally false.
SWR, "apparent" and otherwise, is a measurement of the standing waves on a transmission line. There is no "constructive" or "destructive" effect upon the SWR reading.

> To determine Apparent from True SWR, you'll need to use
> random lengths of coax for the patch cord of the SWR meter.
> The change of the coaxial length in the overall system,
> would change the Apparent SWR, while the True SWR will
> not change.

Totally false. What he calls the "apparent SWR", the SWR measured at the meter, is indeed the actual SWR at the meter. It is possible for the SWR at the meter to be different than the SWR at the antenna due to minor coax losses but this difference is generally small.

>Apparent, is like a point of view of an event.
>
>True, is based upon factual, or physical evidence of an event.
>
>Research needs to be done to determine if you are viewing Apparent or
>True SWR. So, the SWR really should be checked in at least, two
>points, or at the antenna, and a random length along the line. The
>differences, if any, give you the SWR at that point, and if it has
>changed from the antennas own SWR, you are then into a problem with
>Radiating coax, and the system suffers in performance due to it.

Standing waves are well understood and only one measurement is needed along a transmission line. However, I won't stop your research. It wouldn't hurt for you to research the work already done and the knowledge that already exists.

"Stomp all over everyone".
Pretty sad. This is why some "radio operators"
buy large amplifiers. You know who you are.
To be louder than the next guy, as if what
you have to say is any more important than what
someone else has to say. This will be the
epitaph that accompanies the death knell of
cb radio as some of the more sane among us
will remember it! Channel 6 operators are the
epitome of the inanity of such pasttimes.
Another of many situations where the majority
of operators will be punished for the stupidity
of a select few.
But in an age where most people talk "at"
people instead of talking "with" them, this
should come as no surprise.....
Anyone who is interested in preserving what
is "left" of the CBRS and would like to see
some much needed changes take place must
realize that the only way this can be done is
to organize and band together with this as
our common cause. It would seem to me
presently that the best way to go about this
would be to find a forum that is geared to this
end and give it our wholehearted support.
In the course of our "busy days" it might
behoove us all to check out the web site at:

http://home.att.net/~uscb_association/index.html

Here is an opportunity for cb radio operators
around the country to have a say as to what
happens to the CBRS in this country. To have
a voice that the FCC will have to pay attention
to, especially in light of their present policies!

"United We Stand, Divided We Fall"

There is no In Between

Part of Bob's post is correct and the other part is correct only under
certain conditions. Jack is correct only under certain conditions
(but these conditions are pretty typical).

The SWR measurement is basically a measurement of the percent of
reflected power (as shown in the chart). This power is not
necessarily lost. However, it is typically lost.

A typical scenario would be a CB radio with a 50 ohm output impedance. Reflected power would impinge upon this 50 ohm impedance an be terminated (lost).

Another possible scenario would be a radio with an antenna tuner on its output. This tuner could be tuned to make the radio/tuner output impedance equal to the complex conjugate of the input impedance at the radio end of the transmission line. At this impedance, reflected power is actually re-reflected back to the antenna. While the antenna still reflects the same percentage of power impinging upon it, that incident power level is now higher because it is now the sum of the radio output power plus the re-reflected power. The antenna now outputs a power level that is equal to the radio output power level. Thus, in this scenario, the power is not lost; no heat is created.

Funny thing about that...a couple of weeks ago, I visited that web site, and in fact, I applied for membership in that organization, and after submitting the application, the next page that came up said that the application would be reviewed and I'd be notified of the result.

Well, I never got any notification of whether or not the application had been reviewed. I did notice that this morning, the USCBA newsletter showed up in my mailbox, but they never did tell me if I was a member of their organization now or not. This makes me wonder if they are primarily interested in getting together a sizable membership so as to be able to gain credibility in the eyes of the FCC, or if their primary purpose is to collect addresses to send propaganda to.

> Here is an opportunity for cb radio operators

The above SOUNDS good, I admit...but if the USCBA can't be bothered to listen to the voices of those who apply for membership in their organization, I have to wonder........

Doesn't make sense to me... Simple is to use a standart external HF radio power supply, or find something out of an old tube TV that would work, yep, they work...

You may know Silly's, but not the amps...

A sweep tube amp transformer was usually nothing more than a transformer pulled out of service or off the line of a radio manufacturing plant and put into an amplifier.

So, they would be the same.

I don't run the 200A... The rotor is a little harder to turn, and I typically see 202A at slightly over 18 V out of the 165 chassis.

If you are running the 200A version, you will be able to get by with three of them on your station, but using a TX800 to drive a 32 pill will be way underdrive anyway...

Anyway, your right... It is all opinion.

But I will still stand by the rule of one 365A alternator per 8 transistors. Always worked, and I can always hold max power... Either swinging forward, holding it at carrier, or max PEP on SSB.

You can do it with less, but you can't hold it with less.

RCi doesn't make them all...

Their is also Wireless Marketing to deal with.

The cheaper radios (shit Copper products, etc.) are made by them, and you also have the Ham International bunch made by Cybernet.

Then, their are a couple other manufacturers out their. Duf Sommerkamp also made their own line (produced them with no help of other people) for a while, but they where next to impossible to get stateside. I have only seen two radios, two models..... All Plessy Semiconductors inside, and used the MRF 454 for a final.

Ass kickin' radios, but hard as hell to get any information on....

And no, they are not the same as the Sommerkamp of today. Same company, different radios.

I hate to take sides,

But since you claim that it is so great, because you live less than a hour away from DG,

X-Force has been shipping and delivering in less time than that!

So, what does that prove?

Personally, since I don't sell CB, nor am I in the CB business, I could give a shit about who sells what. Dave's boxes are good boxes. I just have heard too much shit about having to wait.

Dave's builders have said that X-Force is a direct copy of the Dave design. If you can get a box, and not have to wait, and it is a direct copy, then why wait?

That was the whole point.

1460. FS Leader CB Signal Generator

Newsgroup: rec.radio.cb
Date: 1999-11-09 00:00:00 UTC
From: Bill Grassa <grassa@mpinet.net>
Message-ID: <3828ACDA.D241A8D4@mpinet.net>
Source record: 9845

Built for CB Testing and Repair. This is a Leader LSG-227. Some features

are :
1) Center +1, -1 and adjustable frequency to +/- 5 Khz.
2) PLL 40 channel.
3) Mod Output 400Hz , 1Khz and 2.5 Khz.
4) Modulation adjust from 0 -100%.
5) Calibrated output from -110 to -10 Db.
6) Twin Meters.
7) ANL/NB Tester.
8) Delta , Led's , ect...
9) A bunch more.

Almost like the B&K 2040 except made by Leader and a tad smaller.

Can be seen at the top center of the picture at
http://home.mpinet.net/grassa

$275 Shipped.

Greetings!

Let me know when you've tried the links.

And what kind of radio are you using?

Much of the "noise" problem stems from what you're up against.

Company Car - can't touch it.
Auxillary Power - not sure of the power supply, if it's clean.
Antenna - Although small, shouldn't a big problem. Relocating the
antenna is another choice to see if noise goes down.
Radio - Noise rejection, kinds of filters the radio uses.
Theres' a difference between a Pro510XL vs a Cobra 29,
a simple Hand Held "HELP" radio versus Mobile.

So many different choices. All are inter-related to the problem you
have with noise.

Not a simple fix.

While Dancing with the Mouse on 09 Nov 1999 08:28:14 GMT, the Modem
interrupted with an MNI from "cgo2541273@aol.com5200 (Charles
Golden)", and the MotherBoard buffered this to Video RAM:

:+> actually I am using the aux power under the driver seat.
:+>

1469. Re: SWR Power Loss Chart

Newsgroup: rec.radio.cb
Date: 1999-11-09 00:00:00 UTC
From: Jack Thurston <fire228@cybertrails.com>
Message-ID: <3828BC33.70BE6715@cybertrails.com>
Source record: 9904

Hey Stupid,

We are talking about "TYPICAL"
applications. CB radios have
an output impedance of "50 ohms"!
We are all in a newsgroup
called "rec.radio.cb"! Get the
picture? No special cases are
being discussed here! Energy
can neither be created nor
destroyed. The test scenario
is this. The swr at the feedpoint
of this antenna measures 3:1. The
chart says that at a 3:1 swr the
percentage of tx power being
absorbed by the load (antenna) is
75%, or 25% of the tx power is lost.
Now, given the information above,
If it wasn't converted into heat,
one of you tell me where the 25%
went? I want to know why
I'm replacing final transistors
in these radios due to damage from
operating them into grossly mismatched
antenna systems. If it isn't heat, then
WHAT? I'll tell you why. Because
operating this equipment into poor
excuses for antenna systems with
high swr's BURNS UP the final
transistor. If you still don't
believe me, you moron, then try this!
Hook up your cb radio and operate
the transmitter with no antenna,
(an extreme exaggeration, hoping you're
not too dense to understand) and hold a
finger on the heat sink and tell me what
you feel! DUH! feels like heat,
don't it! Well stupid, that's where
all of your reflected power is going!

Jack

For reference, the coax usually gets the brunt of the absorption.. Not the radio, and not the antenna. Usually it is the coax. However, to prove a point, please read on:

. If it isn't heat, then
WHAT?

>>>>It is actually a high RF voltage that is breaking down the junctions of the transistor.

I'll tell you why. Because
operating this equipment into poor
excuses for antenna systems with
high swr's BURNS UP the final
transistor.

>>>>Not burns it up, per se, more like develops a high RF voltage that will puncture the junctions of the transistor.

If you still don't
believe me, you moron, then try this!
Hook up your cb radio and operate
the transmitter with no antenna,
(an extreme exaggeration, hoping you're
not too dense to understand)

>>>>Actually, this will work, and their will be no problem. Most transistors are rated at 30 to 1 SWR, at all phase angles.

>>>>I have done this. It was on a Cobra 29 and a 148. Both radios worked flawlessly.

>>>>Unless you are completely overdissipating the transistor, nothing will happen. Keep the carrier to the level prescribed by the manufacturer, and you have nothing to worry about.

and hold a
finger on the heat sink and tell me what
you feel!

>>>>And if you would really like to feel things getting a little warmy, try touching the caps and inductors in the tank circuit! That eats up WAY more RF energy than the "finals" will!

DUH! feels like heat,
don't it! Well stupid, that's where
all of your reflected power is going!

>>>>If you would like to prove what I just stated, here is a simple test that will show you exactly what is going on, and will also let you save your radio in the event of an antenna or amplifier failure.

Take a zener diode, rated at 16 to 18 volts, 2 watts, and run it from the collector of the transistor (directly to the collector, not after any bypass caps) to ground, observing the proper polarity.

Now, key the radio up and enjoy.

If you would like to see the fuse in your radio pop, screw up the match.

The resultant high voltage will hit the avalanche point of the zener causing it to begin to conduct. Because this diode is also shorting out the DC supply line to the transistor, it will short the radio, blowing the fuse!

This can also be applied to amplifiers, you just have to use larger zeners, so they will be able to pass the current in the event of an amp failure. It will also let you see if someone is volting your amps, or if they are getting power spikes on startup or something else.

Enjoy. I just taught you the cheapest and best VSWR protection circuit.

Guess you don't want to use a high Q antenna (which provides the most effeciency) with a radio that has a lot of channels, do you?

Toll Free

That is not true, either.

If that was the case, then you could put the antenna tuner anywhere in the line, and it wouldn't make a difference.

Somewhere along the line, it became convenient for people to tell others that it just gets rereflected until radiated.

Folks, this isn't the case.... Otherwise, transistors wouldn't be overdissipated when run into a high swr, amp units wouldn't get hot, and coax wouldn't get warm.

You can hope all you want... Unless it is a tuned line, the power won't get rereflected... It will get absorbed by something.. Coax, antenna and output network.

Toll Free

In my experience I agree as well, I was once told I could efficiently run 8x2879's on a 165, I found out if I run the key up and held the bird still (no forward or backswing) that I would lose voltage, this was caused by not enough alternator, I also know that I could not effectively run 16 pills on a 270 and not lose a little bit of voltage, That test being done with a 2 2290 x 6 2879's for a driver with the driver @ 16 volts and the 16 pill @ 20 volts, but as you said its just opinion.

The Mura mic is the same as the Midland power mics of the day.

I used to have a Mura DX-116 power mic. Not a bad mic, especially when run into a clean radio. Clear audio, good amp section.

1. I hope you learn to program HTML and JAVA better.
2. I hope that you learn vector based graphics. Otherwise, you are already dated.
3. I hope that you REALLY didn't spend that much money on your education.
4. I hope....

Ahh hell.

Your site is barely average... No bullshit, just the way it is.

A bunch of bragging about what you have. Who cares. I don't talk to you, and have never heard anyone else talk about talking to you.

8 pills
3 Leece Nevilles.
All Texas Star

I got down.

I picked this big pig up a couple years ago and am eyeballing it again. I am considering fixing it or getting rid of it. It worked last time i plugged it in, (1997)and had the big caps and a few other parts in it replaced right before i grabbed it up cheap. The previous owner got rid of it because he either gave up on it or got sick of the thing..It did about 800w or so when i last had given it a rip, but it needs a looking over by someone who sticks their fingers in tubesets for a living :)
Anyone in the central Connecticut to southern Massachusets area that is interested in repair estimates or buying it can mail me at GMpartsguy@msn.com , i dont think id wanna mail this thing anyway..hehe
See ya on the air

O.K., let's look at this mathematically.

If you are running a 2SC2879...

You have to run 12.5 volts on the collector, because Toshiba tells you that you have to... And at that voltage, they are rated at 20A input.

As you volt the amplifier, you increase the current dramatically (if you would like proof, look for Professor's ramblings on it last year... He tried it and reported it), so we will look at the average power draw, just remember, as you bring the volts up past 14 or so, the current pull goes WAY up.

The numbers above are for an optimally designed network, running class AB bias. If you take the cap values of the dave and other battle boxes, you will see that they are geared slightly low so they don't draw as much peak current at the higher voltages, and they are run class C, so they have slightly better efficiency. However, this will only give you about 14 volts or so that you can run.

Now, 20A per transistor.

8 X 20A = 160A
16 X 20A = 320A
32 X 20A = 640A

Factor in the driver (and if you think that a good running 4 pill won't draw 80 or more amps, you better think again! My 4 pill will blow 3X25A fuses with just a little bit of long windedness.) and you are well over what is needed.

Can you get by on less? Of course. I have run a 16 pill on a single alternator before, just to test. I was able to get 6Kw out of it carrier, but after about 10 seconds, the power was down to 4Kw... And that was all because of the volts falling off, because the batteries lost the top charge, because their wasn't enough alternator!

I can also run my 16 pill with a single alternator, but I can't get long winded with it. However, the current draw from my alternator is humongous, and the thing is sitting over 150A all the time (I have 450A shunts on my alternators, so I can monitor each alternator, or all of them cumulatively to see the total draw). However, when running the 8 pill, the constant current goes down to the 50 or so amp level, and the voltage is at or above 16.5 volts. However, when keyed, it is pulling 200A or more (depending on the case temperature of the alternator.. This is another variable to watch... If you keep the alternators cool, they put out more amperage, but when they heat up, and you are still stressing them, they will drop in

amperage, as well as begin a self destructing process).

Your batteries should only be their for supplying peak current, and not for the buffer of a underfed electric system. That is what you are looking at doing.

If you have any other questions, please feel free to ask. I hope this helps, and shows you what is really going on.

This may be true when changing the taps on a XFMR or the windings in a motor, but this is not true when you raise the voltage to the 2879's, if you do not believe this you can test for yourself. When you change the taps on the windings of a motor you are still producing the same horsepower, you are just changing from a series winding to a parallel winding and visa versa, this is done on a XFMR by changing the taps to achieve a different ratio. But if you take a 100 watt light bulb at say 120 v on a variac and increase the voltage you will notice that the current will increase as the lamp gets brighter, this is the same with rf transistors when we increase the voltage. I am not trying to prove you wrong, break out your OHM's pie and do the math.

Hey Toll I agree with this 100%, and the further above battery voltage you attempt charge the higher the current draw on the alts, and the more batts the more current draw required when you increase the voltage above the batteries idle volts, If he were to run the cap bank he would realize how much of a voltage drop was really occurring.

I am looking for the parts to add 17/12 to my early (s/n 04xxx) Yaesu FT107M. Does anybody have a dead/dying late model rig s/n 06xxxx+, or an early one with the RF and LOCAL boards populated in the AUX positions? Maybe an original Yaesu WARC kit? Also seeking the beige face VFO and transverter.

Hello Mr. Strohm,

My original statements had to do with a post elsewhere in this
Ng pertaining to a customer's lack of understanding as to why things
cost what they do even though the customer perceives the work to be
minimal and trivial.
My mistake was in not replying to that particular post and going
ahead with a new one. My faux pas.
The gist of it had to do with the price of retuning a radio. The
poster seemed to think that the tech was just gonna go in there and
turn a screw or two and call the unit tuned. This wasn't to do with

deciding to replace a defective unit or repair it.
Although I think you misinterpreted what I meant and posted with a different thought, I would like to reply.
I agree with you in that there comes a time when repair might be the least cost effective for the customer even though the end result is the customer would pay a tad bit more for a new/newer piece. Under these circumstances I always let the customer decide if the repair was worth it without trying to influence them into an upgrade...unless I had a very strong feeling that the radio was on it's last leg.
As far as taking trade-ins towards newer gear. The markup on what I sold did not leave room for negotiation nor trade-in allowances on equipment that I would not put back out for sale. You see, if I told the customer he had a radio that was not worth repair, I meant it. I never took a trade in under those circumstances because I wouldn't put that radio back on the for-sale shelf. If I allowed such a trade, I would not make the correct profit on the sale and I would have to work twice as hard to recoup that loss.
Going a bit further on the trade in thing. I never did like to take a trade because I felt like I was screwing someone. In order to make a profit on the trade I had to low ball the value of the unit even though it was an ok unit. I know the customer had a good idea of what he could get for the unit on the market and I felt like I was insulting them with my offer. I know what it's like to trade in vehicles and how much I hated hearing your car isn't worth what you think it is. I just didn't want to lay those feelings on my customers.
Now, to the people out there who don't understand what goes on behind the scenes.
In the world of "Real" Electronics Technicians there is a certain satisfaction that only comes from a job well done. That means having some pretty sophisticated and expensive test equipment to verify your measurements, adjustments and repairs. Just to give you a clue what just one indispensable device costs. How about $12,000 to $20,000 for one piece of test equipment.
If you really know what you're doing you can oft times "get away" without the fancier pieces of gear but this degree of knowledge only comes from great amounts of experience brought about by using the fancier test gear. To "get away" without the fancier stuff you need to have a real understanding of the consequences of your part changes and adjustments and you need greater skill in interpreting the very subtle indications of the "make do" test equipment that you {are} using.
Does anyone realize the cost of the test equipment and what price you have paid for your experience? Not really. The customer doesn't have a clue and doesn't really care. All he wants is the best radio performance for his money and rightly so.
What customers do need to realize is that we have a tremendous investment in ourselves and the equipment that we use and we do

deserve to make a reasonable profit from each of these. As customers, you need to also realize that it is only through great amounts of experience that we can make the repairs, modifications and adjustments look so easy.
So for the next time you get a glimpse of something that looks too easy you can bet your ass that we paid our dues learning how to make it look that easy.

Yeah, that was them, CRB. I circled their number on one of those reader service cards in PopComm once, about three years ago, and I'm still getting stuff from them in the mail (CRB, not PopComm). They do sell some pretty interesting books and stuff though, that you can't seem to get anywhere else.

Isn't that, like, sacreligious or something? :-)

> different interests within radio for people to enjoy. As for the
> people who sounded off about my use of my monitor registry I.D.,
> well...I'm not going to waste bandwidth replying to people who
> criticize something that they obviously know nothing about. :-)

Hey, if they're that dumb that they can't tell a registered monitor ID from a ham call, why not point out how dumb they are? Maybe they'll be embarassed enough that next time they'll think twice before opening their mouths about something they don't know jack about.

I mean, three letters before the number...I'm not even a ham, and I'd know better than to waste my time looking in a ham callsign database for what is obviously not a ham call in the first place.

> KC2FNG, KNY2VS, KJK-14120, KSO-9650, AE279

Just out of curiosity...those are ham callsign, monitor registry, current CB call, old CB call, and sideband numbers, in that order...am I right?

Thanks Guys, I mixed up my connection order. I do infact have the
ant tuner last. The amp i'm using is a small 225 blue. The antenna
is a ABS1600. I like the antenna pretty well overall, but not keen
on the fact its not tunable. The swr on the antenna is fair, and i
realize that a 2 or lower is fine but I like my swr as flat as possible.
Thats why I use a tuner Scott. When your running an inexpensive small
power amp for a basestation I feel the lowest swr possible helps a
little. Maybe not much, but a bit. The thing that I noticed about my
225 is that on low\high I get forward mod\power, where on med setting
I get backswing according to my swr\power meter. Yes I realize these
are mass produced, and not the best quality control but thats all I
can afford.

Thanks to those who offered their 2 cents.

Jeff

Can some one explain why you can drive a 16 pill with a M400 and one 250 AMP alt.
But you tell me I cant drive a 32 Pill with an M800 and just two 250 AMP alts?

I know not every one finished college algebra, pre calculus, calculus I, and calculus II like I have done but this math problem is very simple come on.

If toll free or any one in this world can answer this question intelligently I will never argue on this News Group again!!!!

Please Im all ears. I don't want to hear you cant run the 16 pill with one 250 AMP because me and two other people I live near peak 2,800 -3,000 watts on a bird meter @15 volts higher @20volts no problem like this.

Greetings!

Unfortunately, the same could be said about todays CB radios.

For instance...

PC-122 from 89 era' lot's of parts. Fewer problems with marginal
voltage rated parts. You can find them.

PC-122XL - many parts removed, lower quantity of parts. Even changes
to the main PCB to lessen copper and reworked some sections to make
them stable, but fewer support components that can be found readily.

With a little work, these older chassis designs can do wonders for a
itty bitty radio like those PB-122 chassis designs. Heck, they still
have the holes for the parts they took out!

As far a Cobra, well, I'm not going to tread there. Their mfgs' are in
too voltaile of areas that need stable democracies. It's hard to find
good help.

The best answers to the "charge for it versus fixit yurself'" is;

locate a book or two about radio,
read the mods out on the 'net,
acquire as many schematics as you can,
buy junk radios to help you find and locate parts,
Time - lots of it,
Patience - you'll need it,
Intuition - hey, everybodys gotta' learn,
Stamina - broken radios will test you. ;-)

Greetings!

While Dancing with the Mouse on Tue, 09 Nov 1999 16:39:25 -0500, the Modem interrupted with an MNI from "anylength@willdo.com (Coax Length Police)", and the MotherBoard buffered this to Video RAM:

:+> Standing waves are well understood and only one measurement is
:+> needed along a transmission line. However, I won't stop your research.
:+> It wouldn't hurt for you to research the work already done and the
:+> knowledge that already exists.

Wow!

Are you a Ham operator?

I think you need to read up on the research.

Hint:
Z = ...

What happens then, when Z of the antenna, is different than Z of the coax?

Another thought process...

Known feepoint impedance, to match the known output impedance. What occurs when both differ?

How is coax used as a balun?

Why are multiples of 1/4 wave, thru the use of coax, offer different levels of SWR, when the feedpoint impedance is known to be far off?

Apparent versus True. Is it characteristic? Both can apply to the latter.

Now, apply the above thoughts to dipoles.

The common denominator is with coax and various lengths.

You have the coaxial impedance at any given point, and feedpoint impedance throughout the whole line.

When Zcoax <> Zantenna = what is the equation? It's R-jX or R+jX?

What occurs when -jX and +jX summed together, approach zero?
How can that be accomplished?

The biggest hint is a dead giveaway...

It is known that open ended coax, when trimmed to varying lengths,
offer varying Z from nearly Z=0ohms to Z=infinite.

Now, apply an antenna as a tuning stub to this...with it's own R+/-jX

We should now have a pretty good idea as to how coax can either act as
a mere conductor, or react as if it were part of the antenna.

Do you agree?

Regards!

Hi, I have a Johnson Messenger 100 mobile forsale. It has channels, A, B, C, D, AND E in it. Do not know if it has any crystals in them. No way of testing, no power cord. Comes with original mic. I'll take $8 plus shipping. Also, I have a Johnson Messenger III, it also comes with original Johnson mic. Has channels A, B, C, D, E, F, G, H, I, J, K,and L. This one does not come with power mic cord.I'll take $8 plus shipping. All are untested, cause I do not have any crystals to test them. The Johnson Messenger 100 was REALLY dirty. I cleaned it up REAL GOOD. The Johnson Messenger III has alittle scratches, but nothin bad. Also, I have a Johnson Messenger II (Blackface) forsale. Has 10 channels. channel 9 crystal is the only crystal in it. It has no mic. So I can't test it. Has all the tubes in its slots. I'll take $25 plus shipping. Also, I have a Johnson Viking Messenger (Whiteface) forsale. Has no power cord. Comes with mic, but it's not wired. It has a four pin and the radio. Mic comes with plug. Has all the tubes in its slots. Has no crystals. It has been repainted because of old age. It looks REAL NICE. I'll take $15 plus shipping.

Email me if interested.
For all = Johnson Blackface- $25
Johnson Whiteface- $15
Johnson 100- $8
Johnson III- $8
All together = $56 plus shipping
Or buy at a time... Buckaroo "223"

Er, that was my point....

1522. HELP: Radio Part for DRAKE TR-4C

Newsgroup: rec.radio.cb
Date: 1999-11-10 00:00:00 UTC
From: kaijiang5572@my-deja.com
Message-ID: <80aolh$1ah$1@nnrp1.deja.com>
Source record: 9864

Hi,

I need a part for an old DRAKE TR-4C transceiver
made in the sixties. I know some companies still
produce this part today but I couldn't find out
who and where to purchase from. Could anybody
point me to the right contact?

It's R10E1-Y4-V2.5K 48V DC AMF for TR-4C DRAKE.

Please reply to kaijiang@stanford.edu

Thanks a lot.

Regards,

Kai

Could anyone out there be so kind as to tell me a place to get the schematics / manual for an Eagle Mark 8 Tube Linear (I think it may also be known as an Eagle 1000, but I am not sure)? It has a Simulated wood grain finsih, lit switches, and uses (7) 20LF6's. I am pretty sure it was manufactured in the early eighties or late seventies. Also could someone fill me in, Is this linear made by a company named Kenrich? If not who?

Thx a lot for the help, it's greatly appreciated!

>hobbyist "escape the idiots".

I think this is a reflection of society as a whole. It's the old "don't wanna get involved" syndrome.

In New York City a few years ago a woman was murdered in front of a whole bunch of people and nobody even called the cops. The same people who do things like this probably also gripe about how high the crime rate is in NYC and whine that they are afraid to go out at night.

This reflects an unwillingness in our society for people to take responsibility for their own actions. It's easier to find fault with someone else.

The people who have to eat Kraft dinners every night instead of meat and potatoes because of exorbitant taxes, insurance rates, utility costs, etc. blame the politicians for all their problems, but God forbid that any of them should actually go to the polls and participate in the electoral process themselves. Why, they might find themselves branded as an "establishment lackey" or something.

The people who are afraid to go out at night because of high crime rates in their neighborhoods blame the cops and the courts for the conditions where they live, but God forbid that they should ever actually pick up a phone and call the cops when they see a crime in progress, or sign a criminal complaint, or go to court and testify. Why, they might find themselves branded as a "narc" or something.

And the people who gripe about the state of the CB band today, well, God forbid that they should actually make an effort to find out who some of the offenders are and report them to FCC. Why, they might find themselves branded as "rf police" or something.

We have a situation in our society today where the emphasis that we had, say, 30 years ago on the individual being held responsible for his or her own actions has been diluted to the point where we have now raised an entire generation of people that has absolutely NO sense of responsibility for their own actions. Almost an entire generation of people grew up with no respect for their parents, their teachers, the law, or even themselves. It used to be that if a kid got too far out

of line, the result was that they got expelled from school. Nowadays the public schools can't even do that. The ACLU and other bleeding-heart liberal organizations like it filed lawsuit after lawsuit, until now we have a situation in the public schools where a teacher can talk about every manner of sexual topic imaginable...as long as they don't dare bring up the subject of God in a classroom.

Ever wonder why all these shooting rampages in schools happen in public schools and not in private or parochial schools? It's because the private schools can still expel troublemakers. They have the stick to go with the carrot. They can - and do - back up the authority of the teachers and faculty members, which the public schools can't. Thus, their students at least learn some sense of being responsible for their actions...learn at least some respect for authority. People blame the NRA for all these school shootings and such...they ought to be blaming the ACLU instead.

And yes, a lot of people blame FCC for what happened to the CB band after deregulation and the end of licensing on that band...but you know, nobody from the FCC ever fired up an illegal amp on that band. Nobody from the FCC ever modified a radio to transmit on unauthorized frequencies. And nobody from the FCC ever organized a keydown, or drove around town playing music on top of people's conversations, or interrupted a QSO between two people they don't even know to question the moral character of the parentage of one or both of the participants in as obscene a manner as possible.

It wasn't FCC who did any of those things...and it wasn't FCC that failed to file a complaint with the proper authorities when that type of behavior was observed on the band. Now, if someone behaved that way on one of the business bands, or in a public safety band, you can bet your bottom dollar that the phone would be ringing at the nearest FCC Field Office, possibly while the offender was still on the air. But on the CB band, for some reason, people stopped doing that some 25 years ago, and that's the reason we have the mess on CB that we have today. As the saying goes, if you aren't part of the solution, you're part of the problem. But if you think about it, the people who populate the CB band are pretty much a cross-section of the people who populate our society...so why should we be surprised that the problems that plague our society today, also plague the CB band?

73 and good DX'ing,
John D. Kasupski

You should have been a movie star with the roles you play.

>Wrong again Steve, if someone calls for your product you would hope the
>dealer
>would try to sell them yours instead of pushing them into another unit.

We did, just never had many calls like you think, let the ego go! We were known for the X Force products.

>Who is team davemade? >

People who for some reason come out of the closet when davemade is in a bind.

> People have emailed me in the past after they have
>inquired about buying an amp from you, they are not my buddies just
>consumers
>who didnt like your sales pitch. >

Due to the fact that they would have to wait 2 to 4 weeks for delivery. Sure you would say no way, but the proof is in the receipts. Our sales ratio is 8 orders for every 10 calls. Humm, this is only due to the way we have taken care of business. Went from two employees working to now 15 employees and we just hired yesterday and today.

>Whether you like it or not it has happened.>

Not a problem here.

>Sorry cant do memphis I do the family thing on Thanksgiving.>

We will do the family thing as you call it and then do it again in Memphis, Happy Thanksgiving to you any way.

> I know we again
will be the hot topic of your conversations at memphis though. I am not
>crying
>you posted wht you did and i replied with what i feel are the facts>

No there will be better things to discuss than Davemade products or you! As for facts, do you really want facts, dont think you do. They may be detrimental to you. Have a great day.

I guess I have to take your word as like I said some where before I don't build amps, and if it breaks I wont be the one to fix it. Yes I could replace parts by myself, yes I can build a box by looking at some one else's buy why bother? There are many people who build wheels but only one inventor. this kind of gets off the subject but how cares I see allot of that on this ng

out-band
> issues. but if you, as a ham, can't go into the out-bands and we, as
cb'ers,
> are willing to suffer the consequences for doing so. WHAT IS YOUR
BITCH ABOUT?

Maybe it has something to do with the fact that a lot of the hams in
here are also CB operators, and get sick and tired of other hams AND the
general public painting them with the same brush because of the actions
of morons like YOU that can't be bothered to obey a few simple rules
that specify where we are allowed to operate and how much power we are
allowed to use. I'm a Cb'er and I operate legal power on the legal
channels. I'd like to see the band free of people like you with your
illegal amps that cause you to interfere with comms several states away

that you can't even hear to know you're interfering with someone else because you're too busy blabbing to hear anybody else.

You bitch about other people's attitudes in here...you're the one who needs an attitude adjustment. Your behavior on the CB band and your encroachment on parts of the RF spectrum where we as Cbers are NOT supposed to be transmitting...you jerks are the reason we will probably NEVER see any further authorized frequencies, or get the FCC to let us legally use FM on the CB band. You and people like you screw everything up for everybody else...and you could care less what effect it has on anybody else's rights or privileges. Screw you!

> YOU TOO want this right so dump the horse shit rightious attitude. it makes you
> look like an idiot.

I've seen enough people in this newsgroup call you an idiot, too...and other things. After lurking here for awhile, I can see that they are absolutely right. You are one of the biggest jerks I have ever seen on Usenet. But you don't need anything to make you look like an idiot, all you have to do is be yourself.

Who's causing the wounds? There wouldn't BE any misery on CB if peabrains like you obeyed the rules and stopped ruining the band for the rest of us.

nice if they
> would just let them heal, check their rf police badges at the door,
respond to
> the CB RELATED posts that they like and ignore the ones that they
don't instead

Yeah, sure, I'm sure that you and the rest of your hoodlum buddies in here with no respect for the FCC regulations and no respect for the other users of the CB band would just love it if us LEGAL users of CB just shut up and went away and let people like you go right on polluting the airwaves with impunity. But guess what...that's NEVER going to happen. So take your illegal amps and your non-type accepted radios and shove them in there where they belong. I don't think you need to be told where that is since you seem to spend most of the time in this newsgroup with your head shoved up there anyway.

> of dumping more spam than hormell could make in a year on them and
pretend to
> be professional in their demenor like an elmer to guide rather than a
false god
> who looks like an asshole to everyone but himself.

To me, and probably also to the rest of us in this newsgroup who operate legally, it's YOU who likes like the asshole. I'm acquainted with several hams, and I doubt if any of them would find the likes of you worth elmering into a hobby they enjoy so much. At least not until you showed that you were capable of paying attention to not-so-minor little details such as considerate operation, and paying attention to the rules you're supposed to operate under.

> OH, WAIT A MINUTE!!! WHAT TIME IS IT??? 4:20 AM!!! I MUST HAVE DOZED OFF. WOW,

Could be it's lucky for you that you don't live near him. How do you know he's not a former Navy SEAL who would fold you up like a newspaper, dump you in the middle of the street, give you a good swift kick in the butt and then stand there laughing as he watched you roll downhill into a pile of trash where you belong? Or maybe he runs a karate school, and you wouldn't get anywhere near him because there are two dozen of his students that could wipe the floor with you without even breaking a sweat, never mind what their instructor who is half a dozen or so degrees higher in rank could do with you. So what are you trying to do, make the guy laugh himself to death?

Actually, I think it was a company that advertised in CQ, not the
magazine itself. The same company advertises in pretty much all the
radio magazines.

> I doubt, that there's any harm in being or continuing to use the

The funny part of it is, the guy they're bitching about *is* a ham. He
posts his ham callsign, his registered monitor ID, his CB callsigns past
and present (or so I assume that's what the KSO-9650 is), and his
sideband numbers in his signature file. These jokers are just plain too
dumb to tell one from the other, I guess.

Just as the books will state that a 1/4 wave is the most efficient mobile antenna, that in no way would a coil antenna EVER outperform a straight 1/4 wave, doesn't make it true in radio...real world application. Same goes with all the theory you've learned in your many years of education, that normally using a "rule of thumb" that VxA=W, by increasinc volts you decrease amps, not true in amplifiers in the REAL WORLD.

You're not talking sense here.
How do you figure it wouldn't make a difference?

> Somewhere along the line, it became convenient for people to tell others
> that it just gets rereflected until radiated.

As I said (and you conveniently clipped out), typically the power does
not get rereflected but, with proper tuning, it can. How do you think
an antenna tuner reduces your SWR reading? What happenned to that
power that is still being reflected at the antenna? Answer: it is
being rereflected.

> Folks, this isn't the case.... Otherwise, transistors wouldn't be
> overdissipated when run into a high swr, amp units wouldn't get hot, and

I'm thinking about getting a cb radio and i was wondering just how well channel 9 is really monitored in case i were to assistance on the road. Since cb's are cheaper than cell phones i figured it would be a good thing to have for my drive to college and back. Any input would help especially about monitoring in NC.
Thanks,
Jeff

Apparently something along those lines must have happened.

In the newsletter-bearing e-mail, I found user name and password for
how to get into the members-only section of the USCBA web site, and
upon making use of that information, availed myself of the members
list and found that I am on it. There are another dozen or so people
on it after me, so maybe they processed a whole bunch of people at
once just before the newsletter went out and saved some time by just
sending out the newsletter by way of notification.

In any event, this is USCB-53, 10-10.

So, are you saying that antenna tuners are atypical?

Also, you said, "If the swr is 3:1, then 25% of the power
developed by the transmitter is NEVER going to be seen coming
from the antenna regardless of how many "trips" it makes up
and down the transmission line."

This is simply not true. You *are* wrong. All of the transmitter
power can be made to radiate from an antenna even with an SWR of 3:1.
It was explained how this can happen. I understood the explanation.

> We are all in a newsgroup
> called "rec.radio.cb"! Get the
> picture? No special cases are
> being discussed here!

An antenna tuner is a "special case"? Every Radio Shack
sells them. They are very common.

> Energy can neither be created nor
> destroyed. The test scenario

Lost where? The antenna isn't getting hot. As you said,
power cannot be destroyed. Where did it go? Answer: it
was reflected (not dissipated). That reflected power does
not necessarily get converted to heat.

> Now, given the information above,
> If it wasn't converted into heat,
> one of you tell me where the 25%
> went?

I told you. It was reflected.

> I want to know why
> I'm replacing final transistors
> in these radios due to damage from
> operating them into grossly mismatched
> antenna systems.

It is because you don't use an antenna tuner to
rereflect the power. If you read the message and stopped
name-calling, you would understand.

> If it isn't heat, then
> WHAT? I'll tell you why. Because

Your reflected power *is* being converted to heat in
your finals -- but it doesn't have to be. An antenna
tuner would rectify your problem.

Toll a dm - 5 pill will draw 53 amps at 15 volts into a 50 ohm load. Holding 400 rms watts. I do agree 15-20 amps max per device when in key down mode. Ohms law still comes into play 250 amps x 20 volts = 5000 watts of power created - Efficency = watts

Jeff. The ARRL has certainly taken a beating from you
in this NG. I was wondering if you have ever read any
issues of QST, or the ARRL handbook, or any of their
publications. I have found nothing in any of them to
even hint at the kind of treachery you suggest. I do
however find things like "The Amateurs Code",
written during the early days of ham radio.
Admittedly, it is somewhat 'quaint' in
the light of today's more cynical society, yet the
ARRL still publishes it quite unashamedly in
their handbooks.

I re-read it the other day. It does not sound to me
like the marching orders of a totalitarian organization.

Of course, not all amateurs embrace the qualities
written below. But what's so bad about an association
that publicly urges them to try?

(From The ARRL Handbook)

"The Radio Amateur is:

Considerate... Never knowingly operates in such a way
as to lessen the pleasure of others

Loyal...Offers loyalty, encouragement and support to
other amatuers,local clubs, through which Amateur radio
in the United States is represented nationally and
internationally.

Progressive... With the knowledge abreast of science,
a well built and efficient station and operation above reproach.

Friendly... Slow and patient operating when requested; friendly advice and counsel to the beginner; kindly assistance, cooperation and consideration for the interests of others. These are the hallmarks of the Amateur spirt.

Balanced... Radio is a avocation, never interfering with the duties owed to family, job, school, or community.

Patriotic...Station and skill always ready for service to country and community"

Andy:
Stay on the original subject for once. How do "constructive and
destructive" standing waves that occur along the coaxial line
vary the "apparent SWR"?

The Coax Length Police seem to disagree with your claim.
I do, too.

Jeff,

Channel 9 is not monitored too well in most places these days, but there
are exceptions. Other channels are usually operated during the day and
I have had good luck in the past gettting help on some of the local
"home channels" and on 19 from some of the locals. I personally listen
on 9 sometimes, and often give local info on my home channel or 19. I
live close to the interstate. I think it would be a good idea to have
one. I have one in my wifes' vehicle. Have a great day! Jon.

: applications. CB radios have
: an output impedance of "50 ohms"!
: We are all in a newsgroup
: called "rec.radio.cb"! Get the
: picture? No special cases are
: being discussed here! Energy
: can neither be created nor
: destroyed. The test scenario
: is this. The swr at the feedpoint
: of this antenna measures 3:1. The
: chart says that at a 3:1 swr the
: percentage of tx power being
: absorbed by the load (antenna) is
: 75%, or 25% of the tx power is lost.

No, it means that about 25% of the power is being
reflected back towards the transmitter.

: Now, given the information above,
: If it wasn't converted into heat,
: one of you tell me where the 25%
: went? I want to know why

Almost all of it is reflected back towards the
antenna when it reaches the transmitter output.
There IS some additional loss - and there are
charts that show what it is. The loss depends
on the loss that the coax would have anyway with
a perfect match.

For example: lets assume a forward power measurement
of 10 watts and a reflected power measurement of 11
watts. If you go to the charts, you will find that
this is a 2:1 VSWR. (Note that the transmitter is
probably radiating a bit less than 10 watts - part
of that forward power is the reflected power that
is re-reflected back towards the antenna.

Now assume that you have a 100 foot run of RG-8 coax,
which has a line loss of about 1.2 dB/100 ft at 27 MHz.

By returning to the charts, you would find that the
additional loss was about 0.3 dB. If you were using a
short length of coax, so the matched coax loss was
negligible, then the additional loss due to the VSWR
on the coax would also be negligible.

: I'm replacing final transistors
: in these radios due to damage from
: operating them into grossly mismatched
: antenna systems. If it isn't heat, then
: WHAT? I'll tell you why. Because
: operating this equipment into poor
: excuses for antenna systems with
: high swr's BURNS UP the final
: transistor. If you still don't
: believe me, you moron, then try this!

Sure, the transistors burn up. But it is not due to
reflected power into the finals - that does not happen.
What happens is that you have a mismatch. As the finals
are designed to operated into a 50 ohm match, and yours
(at a 3:1 mismatch) is either 150 ohms or 17 ohms, the
finals cannot operate at their designed efficiency. Now
the power from this reduced efficiency has to go somewhere.
Guess where that is! Right! Heat in the finals! This is
power that never gets into the coax in the first place.

Toll Free (tollfree@bigradios.com) wrote:
: That is not true, either.
:
: If that was the case, then you could put the antenna tuner anywhere in the
: line, and it wouldn't make a difference.
:
: Somewhere along the line, it became convenient for people to tell others
: that it just gets rereflected until radiated.

It does, except for the losses in the coax.

: Folks, this isn't the case.... Otherwise, transistors wouldn't be
: overdissipated when run into a high swr, amp units wouldn't get hot, and
: coax wouldn't get warm.

See my other post. The transistors do not overheat due to reflected
power - they overheat because they are not running at designed efficiency.
THAT is the power that is overheating the transistors - and power that
never gets into the coax in the first place.

Disconnect the coax from the radio and key it up. The finals will run at
0% efficiency - e.g. no power out at all. They will get very hot very fast.

: You can hope all you want... Unless it is a tuned line, the power won't get
: rereflected... It will get absorbed by something.. Coax, antenna and
: output network.

Not all of it will get rereflected. As you note, some of it get absorbed by
the coax. But all the power that reaches the output stage of the transmitter
will be re-reflected. Some of that power will be absorbed by the coax on the
way back to the antenna and is lost.
:

: > radio output power plus the re-reflected power. The antenna now
: > outputs a power level that is equal to the radio output power level.
: > Thus, in this scenario, the power is not lost; no heat is created.

The tuner is not necessary - all the power is still re-reflected. But
by using a tuner at the transmitter - you can now load the transmitter
into the designed load - so it can output full power (instead of turning

an undesireable percentage of the input power into heat). You thus have full power into the antenna (as you note) minus any coax losses. If the coax losses are insignificant (such as with open wire feeders or short runs of coax) then essentially all the power will be absorbed by the antenna.

This is all elementary transmission line theory - and it all can be demonstrated in practical circuits. There are probably hundreds of texts on the subject (it seems just about every college professor who teaches the subject writes his own book). The Radio Amateur's Handbook covers it in a very sketchy and basic way. Far more rigorous texts are available.

1583. Any thoughts on this one? II--meteor shower

Newsgroup: rec.radio.cb
Date: 1999-11-10 00:00:00 UTC
From: "R.J." <rjmcman@nb.net>
Message-ID: <G38W3.582$Up1.3943@newsfeed.slurp.net>
Source record: 9968

Here's another one that I got that I thought may be useful to pass on.
Any predictions for the gurus? Will it be a good one, or bad or skip?

*** Listmaster Advisory ***
Subject: Meteor Storm Nov. 17-18, 1999
Due to the forcasted Leonid Meteor Storm that is coming up, cbers on this
and other groups should be advised and get the word out that skip
conditions may be mildly to severely increased/decreased during this time
as a result of the forcasted Leonid Meteor Storm.
The Leonid Meteor shower (and in this case a Meteor Storm) involves
the earth running into small particles (the size of a grain of sand or
slightly larger) from a passing comet. These particles hit the Earth's
surface at speeds around 100,000 mph and burn up (CNN).

For this group, I am wondering if members on this list try to pass
along reports of skip conditions on AM, Sideband, and the Outband areas
of the CB spectrum during this meteor storm.

Thank You!

Sincerely,
Keith Thews-CB Radio Egroup listmaster

When 40 channels first came out, it was a "Gentlemans Agreement" that channels 31-40 would be for S.S.B. and channels 1-30 would be for A.M.'ers. WHO decided this? I don't know. But it worked fine. THEN, after people started to modify their radios, generally A.M.'ers went down below channel 1, and Sidebanders went above 40. But nowadays... it's a CLUSTERFREAK !!!

Why would a radio be made with low level AM modulation on purpose? It seems to defeat the purpose of having the mode in the first place, since the TX is really poor...at least in my experience (ppl had a hard time understanding me less than 2 blocks away).

Okay, the FCC was created by congress. Actually, I had no idea which
branch created it. I assumed the executive branch and then set out to
quickly describe how that process worked.

Actually, its probably not that important which one created it in this
context - the main point is that it was legally created, contrary to
Green's claims. In this case, Green should read Article I of the
Constitution, instead of Article II.

However, thanks for the correction.

Just applying your own standards to you, PLL. You have repeatedly
claimed that nothing but CB radio topics can be discussed in this
newsgroups - therefore Hams have no business being here.

Well, it is obvious that illegal outbanding, or illegal freebanding,
are not CB radio topics. Therefore, by your own standard, the people
who want to discuss these topics have no business in this newsgroup.

The Hams in this newsgroup also enjoy CB radio, and restrict our
conversations to topics related to that. Or we address topics relating
to this newsgroup, such as the use of this newsgroup by people who do
not belong here - the illegal operators who operate on non-CB frequencies.

PLL, there is simply no good reason why the FCC should create another non-commercial hobby-related radio band when there are already nearly 20 bands in existence for that purpose? There is absolutely nothing that you could do in a new band that you could not do in one of the already existing bands.

Therefore, there is absolutely NO REASON for the creation of a new band. Therefore, it is not going to happen. I'm not saying that, simple logic is saying that.

If you want more than you already have in the CB band, then study, take a test, and get a license. Again, I'm not saying that, the FCC is.

Stop trying to blame ham radio operators for all this. The opportunities are already there - YOU are the only one preventing yourself from taking advantage of them.

A lot of people pull the limiters out of this chassis to get modulation. Put a 1/4 watt 1K resistor from the emiiter on Q39 and Q57 to the board and recheck the modulation. it is unbelieveable! back the stock carrier down to 5 watts(mine came in the box doing 8). Watch it run.....

Hear! Hear! I posted your entire message again because I wanted
everyone to read it one more time. It is exactly to the point of many
discussions in this newsgroup. CB'ers have to clean up our own act it
we want a better radio service. It is time to start protecting our own
self-interests by getting rid of those who harm this radio band.

I 'm going to buy a handscanner but I don't know much about scanners.

I want to use it especially for making emergency calls on mountain trips.
And also just for fun.
What type should I buy?
Is it possible to transmit wtih scanners?

Thanx,

Olivier,

Yes, I have.

You just didn't realize it.

Does this ring a bell?

"I guess I have to take your word as like I said some where before I don't build amps, and if it breaks I wont be the one to fix it. Yes I could replace parts by myself, yes I can build a box by looking at some one else's buy why bother? There are many people who build wheels but only one inventor. this kind of gets off the subject but how cares I see allot of that on this ng"

It should.

You have just proven yourself wrong.

Ohms law is yes, V*I=W, but their are other facets that you need to take into account.

You have shown us that:

1. Your degrees are nothing (what you state doesn't exist. Where are the accreditations from the "Universities" that you attend(ed))
2. You don't know what you are talking about
A. Because of lack of experience
B. Because you didn't pay attention in class
C. Because you never did go to class.
3. You have a lot to learn!

I suggest that you purchase a large current meter, and get a variable regulator (one shown in the pics on your lame web page will work).

Measure the current draw as you bring the voltage up and down.

Problem proven.

And don't try to impress us with your mastery of Lou Franklin's books... You don't even have them down pat yet!

I'd like to know a little more anout USCBA before I consider membership. I have checked over their website, and found nothing obvious concerning a statement of the goals or purpose of this group. I would also like to know how the leadership is selected (is is a club with elected officers or a business). And finally, I would like to know where they stand on certain issues (illegal radio equipment, freebanding, etc).

At this point, their poll suggests that they intend to promote FM, freebanding, and higher power output (seven of the twenty questions related to this). I saw nothing in the poll about the promotion of proper operating practices, the use of legal equipment, or self-policing of the band.

I was also concerned about the question asking if this organization should keep a database of callsigns, handles, names. and addresses. And the question about this organization policing the ranks of CB operators. I would like to know a lot more about the people involved in this group, and how they plan to do this, before even considering either of these questions.

At this point, I have far more questions than answers.

Why wouldn't you use fuses?

What would you say is a favorable max 10 second output from a 16 pill amp being driven by an 8 pill in competition? Hell, there is well over a thousand watts of feedthrough power there!

You, as the EE, would know that, right?

Exactly!

I use current shunts on the output of my alternators (HUGE wirewound
resistors) and a dash mounted ammeter.

Let's me know exactly what is going on.

Where are you going to get an alternator that provides 20 volts at 250 amps?

One that does this in driving around mode, with the stock pulley on the crank, that will do this at rated temperature?

(hint... It doesn't output DC).

> HEAR IS MY IDEA INSTEAD OF BEATING UP ON EACH OTHER AND MAKEIN FUN OF
PEOPLE
> WHY NOT ENCORAGE AND HELP PEOPLE.

We usually try to. You are the one that came here, admitting that you never ran serious high power, then told us that we where wrong.

Their is your problem with this group.... You think that you are right, because you saw something or read something.

Since you are so close to Dave and crew, why don't you drop by and ask Dennis what he thinks of what I say.

You will be unpleasantly surprised.

IM GIVING UP ON ALL THE OTHER STUFF I WAS
> FIGHTING ABOUT.

Giving up, or admitting defeat?

I CAME TO THIS NEWS GROUP STUFF THINKING I WOULD LEARN
> SOMETHING

If you would shut the f*ck up, and listen when you ask a question, instead of asking a question, then arguing with all the answers that you get, you would learn.

Until you learn that basic fundemental of education, you will be a nothing.

Sad, but that is the truth.

SO TURN THE WORLD AGAINST ME.

I don't have to. You have done it with your mouth and fingers.

MY FIST MESSAGES HERE WERE TO STAND
> UP FOR DAVE MADE

Dave already has a reputation as a good box and builder. He doesn't need someone who hasn't run serious power standing up for him. You can have your loyalties, but when you open mouth and insert foot, you make him look bad by association.

When you are ready to run some serious power, come on down to Texas. We will show you a 25K slug popped in the corner, AC style.

And that is the daily driver!

I TRIES TO DO SO WITH OUT PUTTING ANY ONE ELSE DOWN. BUT
> YOU GUYS DID NOTHING BUT THE OPPOSITE.

Oh bullshit. You have come on this newsgroup, putting everyone and their opinions down.

You ask a question, or make a statement, then the first time anyone disagrees with you, you jump their shit and attempt to make them look like an idiot. Only when the rest of the knowledge on the group makes a counterattack do you sit humbly down and admit defeat, but only to an anonymous post.

Nice try at whining, but you suck.

>
> GOD BLESS ALL THE PEOPLE WHO PUT THERE NAMES ON OTHER PEOPLES PRODUCTS YOU

Yes, and God Bless the companies that sell blank faced amplifiers, knowing damn good and well that people are doing it.

Let's see..

That would be every manufacturer of amplifiers out their! So, unless they have a problem with people doing it, I suggest that they continue.

Dave and crew is just pissed because they are making no residuals from the sale of Dannie's boxes. They had no problem with Ricky selling the Galaxy Gold amps, because they where being purchased from them.

So, who is the bad guy here?

> GOD BLESS ALL THE WANNA BE TECHNITIONS OUT THERE YOU KNOW WHO YOU ARE.

Looking in the mirror when you wrote this, huh?

Yes.

The 16 pill (Jason's old box) is still in the closet. I don't run it much.

Too much sentimental value, being Cat's old amp and all.

And, it was one of the first Messenger's ever built for that size.

Any electrical engineer understudy would be able to build a box from
scratch..

Hell, it's real hard...

Turn on the transformer squared = impedance transformation
Vcc squared / 2(Power out) = necessary turns ratio.

Their. You know pretty much all you need. Add 120 pF caps to the collector
to ground and you have parasitic suppression. If you have high gain lot
transistors, decrease the base to ground resistance. I use 7 ohm resistors,
but feel free to use the standard 10 ohm ones.

Hard shit, huh?

And I also think it is funny how you go off on me for stating something,
that has been argued and proven on this newsgroup for quite some time, then
when one other person comes out and states that you are wrong, you make a
feeble attempt at redeeming yourself by agreeing..

But nowhere did you acknowledge that I was right, nor did you apologize for
your childish antics.

I hope that Dave and crew enjoy having a customer like you... Enjoy it all
the way to the bank.

The irony to all of this is that the same people, that complain about the "RF police" hams, are the same "elite" CBers, that operate on freeband, to get away from the riff-raff on the legal 40. Maybe the riff-raff should complain about the "stuck-up" freebanders?

What you say makes perfect sense, and a perfect example of why there needs to be a test to get on to the ham bands. If you give a chunk of bandwidth to "the public" without any testing, then the lowest common denominators of society will ruin it in short order. If you want to seperate the "serious" CBer from the trash, then you have to devise a way to do it. If you give a test to operate on the former freeband, then what's to distinguish it from ham radio? Taking the test seems to be what these people fear/dispise most.

Bottom line, you can't have it both ways.

So, according to you, people that defend personal responsibility, and the accountability to be a good citizen and to follow the rules as set forth by whomever, are the reason that the country is falling apart? Which then implies conversely, that people who ignore responsibilities and rules, are somehow making this a better place? Better for who? In what way? I'd love to hear your "logic" on this one....

Then you conclude with vulgarity.

And we're now supposed to believe this?

You try to tell a nut that he's nuts, and he'll swear that you're crazy.....

You're both right, and are merely arguing semantics. Bob is correct in
that the power is reflected back, but that reflected power is not
radiated, so for all intents and purposes, is lost.

Simple. It's the reflected power "bouncing" back. Since it has nowhere
to go, once reflected, it dissipates as heat loss. That does not
diminish the fact that the power is reflected. But you might as well say
that reflected power is also "lost" as it is never radiated.

Actually final transistors burn out due to the extreme mismatch casuing an out-of-resonance condition that causes the final to draw more current (Remember a transitor draws the least current in resonance) than it can handle.

I've keyed stock, no screwdrivered, 3.5 watt output CBs into no load for hours, and have not damaged the final, because the extra final current due to mismatch did not exceed the design rating of the device.

But you are right about the reflected power being absorbed SOMEWHERE, and being converted to heat.

This is a silly arguement. BOTH sides are right! It's just semantics Reflected power is lost power regardless of what happens to it.

> flawlessly.

I did it to a Spark-O-Matic on display in K-Mart 20 years ago, that had
no antenna (But did have the mike), and no problem.

What happens is when people screwdriver their radios, they push the
limit of the final, so that there is no more reserve left when the match
is bad, so the radios are more likely to pop finals after a peak job,
than if they are left stock (Unless you also replace the final with a
"beefier" part).

I had to repair a radio shack cheapy mobile rig once that had very weak
output. I thought the final had popped, since they were using it with a
very Mickey-Mouse Antenna, with a bad SWR. Turns out the final was fine,
but they cooked the enamel insulation off of the final tank coil (Which
was way too small for that kind of power), from running it out of
resonance, and it shorted out. I replaced the coil with a "bigger" one,
and they haven't had another problem.

I'm not sure about that one. What happens during modulation peaks, when
the peak collector voltage doubles for 100% modulation? Wouldn't the
zener clip the mod peaks?
I guess if you aren't modulating the final stages (in a low level
setup), then this would work ok.

I disagree. Fooled how? Give an example of how the SWR meter would
be fooled.

You didn't choose a scenario. You said, "the [reflected power] is NEVER going to be seen coming from the antenna regardless of how many "trips" it makes up and down the transmission line."

Keyword: NEVER (you even capitalized it)

You were very emphatic (but wrong).

Furthermore, an antenna tuner isn't even actually needed. The transmitter output circuit could be retuned to perform the identical function of the antenna tuner.

Typically, no power is reflected back towards the antenna
when it reaches the transmitter output. If the transmitter
output impedance is 50 ohms, it is a perfect match (termination)
for the reflected power. The power enters the transmitter
and is dissipated as heat.

Use your formulas and/or Smith chart to find the reflection
coefficient for a 50 ohm transmission line terminated with
a 50 ohm impedance.

It *is* due to reflected power. It *does* happen. This
"reduced efficiency" that you describe is the effect of
power reflected into the transmitter.

No, it doesn't. If the transmitter output impedance is 50 ohms, any power incident upon it (i.e. reflected power), will be absorbed; not reflected.

That is not inconsistent with Toll Free's and my position.

Yes, some power is lost in the coax. No power reaching a 50 ohm transmitter will be rereflected.

> runs of coax) then essentially all the power will be absorbed by the
> antenna.

"Loading" the transmitter is functionally equivalent to using an
antenna tuner. Whether you perform the tuning in the transmitter
output circuitry, or with an antenna matcher, you are performing the
same function. You are tuning the transmitter output impedance
(or transmitter/tuner output impedance) to an impedance that is the
complex conjugate of the input impedance seen entering the transmission
line. At this impedance, total rereflection occurs.

A typical CB radio does not provide a convenient ability to "load"
the transmitter. Thus, its output impedance is typically 50 ohms
(where absolutely no rereflection occurs) and an antenna tuner is
a more practical solution.

> This is all elementary transmission line theory - and it all can be

> covers it in a very sketchy and basic way. Far more rigorous texts
> are available.

Yes, it is. So let me repeat my question on elementary transmission line
theory:
If power in a 50 ohm characteristic impedance transmission line, impinges
upon a 50 ohm impedance, what percentage of the power is reflected?
(This is the exact scenario seen when reflected power meets a 50 ohm
transmitter)

>typically see 202A at slightly over 18 V out of the 165 chassis.
How is it that you're able to measure these output current levels when the manufacturers data sheet output curves seem to run out of steam at a little over their rating?

Spinning them faster 'should' only generate more heat, not amps:-)!

I am not criticising, just questioning.

I received the full catalogue from C.E. Niehoff Brushless Alternators.

Did you ever find out more info on the large Mitsubishi 500 ampre?

My last e-mail from Mitsubishi told me that they would look into the availability of such, to date I've not heard back.

I think at the end of the day it's difficult to beat Leece for price V's output. they seem to be relatively mass produced as compared to either of the above or Electrodyne.

As well as continuing down the higher efficiency FET route (no doubt not allowed in shoot-outs) I will spend some time looking into the pro's and con's of switching supplies for the HT in an AC mobile situ.

You mention hash from a switcher supply, which I'm sure can be sorted. Have you used an Icom power supply lately, they are very clean? I have a PS30 on the bench sitting right next to a Harris transceiver and it's totally quiet.

Kind of off topic.

Sorry

Oldmantube thanks for your response. Judging by your response and your name, I take it you know a lot about tube boxes. The particular box that I have most people I talk to, have never seen before, and have no idea what it is. They all know what the Eagle 500 is but are at a loss for the Mark VIII. I have a few more questions I hope you do not mind if I ask you them. So are you saying that these linears are still being manufactured now? If so do you know how I could contact the person that makes them, I need to get a lit switch, one of the bulbs in the switches burnt out on me so it no longer lights. And just ot of curiosity, How much do you think this linear is worth? It is in perfect shape, not even a scratch (except for one switch that no longer lights, but operationally it works), I get about 1.2 kw on am with low drive. If I am not mistaken I think this one was manufactured several years ago. Also is this linear a 1000 watt rated box, a 500 or a 2000? I kinda figured it was a 1000 based upon the output I was getting. Thank you very much for the help Oldmantube,, I greatly appreciate it!

On most of the alternators, including the leece nevilles, if you were to run them at 225 volts DC output, you would just about cut its current capabilities in half. Put one on a test bench, load it up and let it get good and warm and this will be very noticeable. I agree with you on this one Toll.

And to think all the time and money I've wasted reading publications of Turman, Maxwell, Smith, Caron and the ARRL, when I could have learned transmission line theory right here- and for free.....

>and is dissipated as heat.

The output does not appear to be a static 50 ohm load when it is
generating power. Most of the re reflected power does make a
return to the antenna.

>But you are right about the reflected power being absorbed SOMEWHERE,
>and being converted to heat.

Most of the reflected power does re reflect back to the antenna.

Look at it this way: A 100 watt transmitter sees a 3:1 match.
Approximately 25 watts gets reflected back to the generator.
Let's assume no coax losses for simplicity sake.

This is where we get imaginary.....
Put yourself in the place of the 25 watts. You have just gotten kicked out of your home and would love to find a 50 ohm apartment. You come upon transmitter that bombards you with100 watts. Hardly a static 50 ohm termination. You high tail your ass out of there and ask for mommies permission to come back home.
.....End of the imagination

If the reflected power was dissipated in the transmitter then you would have to believe that you could take a TS-940 (100 watt) transmitter and key it at one end of a piece of coax, and then take a 2510 (25 watt) transmitter at the other end and key it.and see a perfect match on the 2510.

I dare you to try it.

> 6 kw RMS WITH ONE ALTERNATOR AND A 16 PILL? OK I WONT GO THERE BUT I WILL
> ASK WHY YOU USE FUSES WITH YOU AMPS??

I know personally that a good 16 will key this easily on a 18 v battery bank, with one alternator. It will not stay up that high for very long. The reason for fuses is simple. Imagine I am driving down the road and Joe blow runs into the side of my truck and shorts out 3 of the 4/0 welding cables going from my charging system to the battery bank in the back, and at the same time he knocks a hole in the gas tank and gas is leaking all over the ground and I am knocked out in the wreck, or what if my daughters are with me? You get the point, I only use 1of the 270's on my truck for drive around and that is to run an 8 pill, I only leave one 300 amp fuse inline while doing this, all the other fuses are removed, but sometimes you want to go to the pump, anyway, all of the fuses are right at the batteries, and I run the 270 independently, I dont run any fuse in competition, I have 1/4"x1" buss bars to take the place of the fuses in competition. When I get back to the hotel the fuse goes back in buss bars come out. Here is a link to a couple of pictures of the truck, you cannot really see the fuses. but can maybe get the idea.

http://www.geocities.com/Baja/Outback/6165/lubbock014g.jpg This is under the hood, the other two alternators are out of site, one down low and one behind the fan shroud. all this is run on one REAL long serpentine belt. I can change to my factory belt in just a couple of minutes, for those long trips.

http://www.geocities.com/Baja/Outback/6165/lubbock015g.jpg This is in the tool box, the small opening on the far side is where the fuses are located, the large opening is where the six gelcells are at, the wires go from the batts to the amps, the wires leaving the batts to the charging system are fused within on foot of the batteries, there is a 4/0 welding cable out of site in the bed of the truck where there is another tool box, the bird slugs are a 5watt (forward) and a 50 miliwatts (reflect), Cause as you know I run only a barefoot radio, I just mounted all the alternators for the hell of it.....ha ha ha ha. P.S. Now keep in mind that all of this is not real, and all pictures are fake.

1658. WTB: large 4 pin amphenol mic connector

Now thats real smart, what happens when your transmitting and your rf
peaks exceed the forward turn on of the zener? Anytime your RF output
exceeds .7 volts in the forward bias direction of your zener, you have
just shorted out your output.

Enjoy. You have just made your transmitter unusable.

Well the other way would be to get a license and SSB to your hearts
content,the SSB portions of those bands are not populated by AMers.I
agree that SSB is a great mode but the SSBers can at least understand
the signals when an AM station breaks in,the poor AMers can't even
understand you guys enough to hear you politly tell them about the
non-existent agreement.

Source record: 10049

I was just wondering what radio was your first. My radio was back when I hit 14 and my father got me the strangest thing. He got me a Gemtronics 40 channel radio. The Gemtronics, was a big beast. Had tubes in it, but this wasn't that long ago. It was 1979, and they still made this radio. It was great, but being young, I sold it about 6 months later, and put down the money on a new RS TRC 449. Now that was a great radio. AM, and SSB mobile, with a chrome face. Best radio Radio Shack ever made. It was a copy of the 138 GTL, and it was moded from 25 to 30 Mhz. I miss that one too. Well, tell us some stories folks.

Mo

When I got out of the Air Force in '80 I took some programing classes to make use of my GI Bill benifits. They were already talking about the Y2K bug then. The instuctor then said all the programs we wrote had to be compatible for use in the next century. We were making the programs Y2K compatible back then without buying new computers.

Mouser electronics would have that relay.

Or, www.rfparts.com

Merrit stocks most of the common relays.

No. It is an error in the reading, and meaningless. Do you run "apparent"
green lights?

Look in QST.

They did it to the old Midland chassis radios.

Fair Radio Sales still has some of them, as does #12, if I remember correctly.
